

CLEAN DEVELOPMENT MECHANISM PROJECT DESIGN DOCUMENT FORM (CDM-PDD) Version 03 - in effect as of: 28 July 2006

CONTENTS

- A. General description of project activity
- B. Application of a baseline and monitoring methodology
- C. Duration of the project activity / crediting period
- D. Environmental impacts
- E. <u>Stakeholders'</u> comments

Annexes

- Annex 1: Contact information on participants in the project activity
- Annex 2: Information regarding public funding
- Annex 3: Baseline information
- Annex 4: Monitoring plan

SECTION A. General description of project activity

A.1 Title of the project activity:

>>

Emission reductions through partial substitution of fossil fuel with alternative fuels in three cement plants of Holcim Philippines Inc.

Version 0203, 0920/0409/2008

A.2. Description of the <u>project activity</u>:

>>

The project activity consists of a partial replacement of fossil fuel (predominantly coal) in the kiln system by alternative fuels (AF) like agricultural by-products (rice husk, coconut waste, tobacco leaves, bagasse, etc.) and sorted municipal solid waste (shredded plastics, shredded rubbers, etc). The purpose of the project activity is to reduce CO_2 emissions generated from fuel burning requirements in clinker production and therefore cement manufacturing.

The project is for implementation in the 3 cement plants of Holcim Philippines, Inc. (HPHI) located in Bulacan, Lugait and Davao. The project activity aims to replace 15% of the heat requirement with agricultural waste and 3.8% with sorted municipal solid waste. The thermal substitution rate has been fixed taking into consideration the technical barriers to be overcome to ensure that production losses are minimized and quality of the clinker is not compromised.

Clinker manufacturing, and therefore cement manufacturing, is a highly, energy-intensive process. The pyro-processing stage, i.e., where the raw material is heated to a temperature that leads to the key chemical change in producing clinker, requires the largest amount of heat in the total cement manufacturing activity. The use of agricultural by-products and sorted municipal solid waste as alternative sources of thermal energy to manufacture the clinker will therefore result in a significant saving on non-renewable fossil fuels.

The project activity will strengthen sustainable development, specifically, in the 3 regions where HPHI cement facilities are located. The volume of non-renewable fuels required in the cement manufacturing process will be significantly reduced, consequently, economised. The project activity will also contribute regionally to the waste disposal infrastructure and will help address local environmental problems. It will bring about wide-ranging benefits to the health and well-being of the community by raising the socio-economic level and improving the quality of ambient air of the locality.

As a contribution to sustainable development in the Philippines, the project will carry out several environmental improvements and socio-economic benefits such as:

• The use of cleaner, more efficient and sustainable solution to waste disposal

One of the various environmental challenges faced by the Philippine government is the proper disposal of wastes. The Japan International Cooperation Agency (JICA) estimates that approximately 2.4 million tonnes of hazardous wastes are generated annually (2002). In addition, several thousand tonnes of

UNFCCC

municipal solid wastes are generated daily. The same study showed that the infrastructure for waste collection, treatment and disposal in the Philippines is underdeveloped. With this problem on waste disposal, sources of drinking water become polluted and the flora and fauna are destroyed.

In many developed countries, cement kilns are the preferred option in the management of suitable wastes since the energy and material value of these waste materials can be reclaimed or recovered. Provided that these are properly equipped with sufficient safety and environmental management systems, cement kilns via co-processing have an enormous potential to help address the disposal of wastes in the Philippines.

• Livelihood and other economic opportunities in the community

Although farmers and rice millers currently earn income from their existing trade, this project is expected to provide an opportunity for additional income. Through this project, agricultural by-products that were once considered wastes will now become a source of revenue, not just to the farmers and rice-millers but, to other members of the community as well.

Wastes that will be utilized as alternative fuels will be yielded by rice husk mills and Material Recovery Facilities (MRF). These wastes will be transported to the nearest HPHI cement plant by trucks. Employment will be generated from the process of collecting, pre-processing and transporting of these wastes. In a survey conducted by HPHI, the biomass supply requires at least 4 people for every delivery of truck load to the plant. For HPHI Bulacan plant alone, it is estimated that 20 truckloads per day is needed to replace 15% of the fossil fuel requirement.

A Material Recovery Facility (MRF) already exists in Bulacan. This will soon be followed by the communities in Davao and Lugait. MRF's in these areas will be installed in compliance with the Ecological Solid Waste Management Act of 2000.

• Provision of new financial resources

The project activity will also support regional economic development. The use of agricultural by-products, previously burned in open air or landfilled in an uncontrolled manner without any value, will create new income sources. The biomass business will provide opportunity for additional revenue for local community. As a result, economic status and social well-being of the local people will be improved

A.4.2. Category(ies) of project activity:

>>

Manufacturing Industries

A.4.3. Technology to be employed by the <u>project activity</u>:

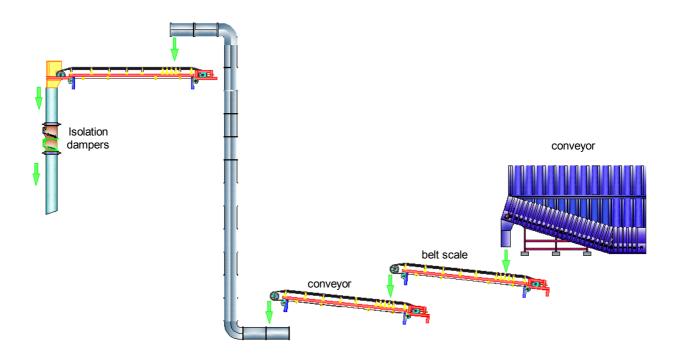

>>

The technology, described below, that will be employed to co-process agricultural by-products and sorted municipal solid waste has been developed by HPHI with the support of experts from Holcim Group. A similar system will be set up in the 3 plants. The department of alternative fuels and raw materials (AFR) of Holcim Group Support (HGRS) provides an insight on the state of the art technologies, exchanges experiences in the alternative fuels selection plus design of installations, develops tools to limit the impact on production loss and clinker quality and establishes quality control procedures.

The system to be used will be set-up in different segments. The first segment aims to install a specific feeding system for each of the 3 cement plants with a dedicated covered area to receive the biomass. For Bulacan plant, the alternative fuels are fed into the separate-line calciner (SLC) and in-line calciner (ILC). For Lugait and Davao plants, the alternative fuels will be fed into the in-line calciner (ILC). The second segment includes the setting-up of the pre-processing facilities, consisting of shredder, screening and conveying system. The third segment aims to increase the capacity by optimizing the installations and replacing the coal to as much as 15%, the thermal substitution rate design capacity.

The figure below shows the feeding facility that will be installed.

All civil structure, mechanical equipment and supporting structure shall have its standard safety devices such as local emergency stop switch, automatic shut-off damper, pull rope switches, access platforms and stairways, handrails, etc.

Alternative fuels such as shredded plastics and rubbers, as well as the agricultural by-products bigger than 20 mm, will be fed through the belt conveyor to the designated feeding point (either to the calciner or through the kiln hood). A weigh feeder or dosing system will ensure feed rate accuracy. The feeding system will be monitored and controlled. The delivery, dosing and storage systems for the biomass and MSW may be further modified and enhanced as experience is gained. The latter will be covered in the third segment.

SLC: AFR deliver point Separate Line Calciner In Line Calciner 0 0 ò -Kiln hood: ILC: AFR AFR deliver deliver point point Kiln 8888

All alternative fuels will be sampled and analyzed before these will be used. Strict parameters shall guide the quality control process which includes continuous monitoring of emission of specific pollutants using the Continuous Emission Monitoring System (CEMS) that has been installed in all the 3 plants. Holcim Philippines, Inc. (HPHI) implements a comprehensive environmental management system in all its cement plants, accordingly, all plants are ISO14001 certified. With this certification, HPHI is committed to manage responsibly any impacts in the environment of its operations.

page 8

A.4.4 Estimated amount of emission reductions over the chosen crediting period:

>>

A crediting period of 10 years has been chosen for the project activity.

| Year | Annual estimation of emission reductions in tonnes of CO2 |

A.4.5. Public funding of the project activity:

>>

The project activity has received no public funding.

B.1. Title and reference of the <u>approved baseline and monitoring methodology</u> applied to the <u>project activity</u>:

>>

ACM0003 / Version 04

Approved baseline methodology and approved monitoring methodology "Emissions reduction through partial substitution of fossil fuels with alternative fuels in cement manufacture".

B.2 Justification of the choice of the methodology and why it is applicable to the <u>project activity:</u>

The approved baseline methodology ACM0003 is appropriate for HPHI's project activity since all the applicability conditions are fulfilled.

The applicability is justified in the following:

- Fossil fuels used in cement manufacturing are partially replaced by alternative fuels such biomass residues (rice husk, coconut waste, tobacco leave, bagasse, etc.) and sorted municipal waste (plastics, rubbers, etc.).
- The biomass residues are available as an excess by-product and, in the absence of the project activity, would be landfilled or burned in an uncontrolled manner without utilizing them for energy purpose.

Rice husk, the main agricultural by-product that will be used, is readily available in abundant supply. Republic Act 9003, known as the Ecological Solid Waste Management Act of 2000, prohibits the open burning of solid wastes which includes, amongst others, agricultural wastes.

- The biomass residue used by the project activity doesn't necessitate preparation requiring the use of a significant quantity of energy. Except for one supplier wherein a small amount of energy is used to prepare the husk, the only activity requiring the use of energy is in the transport of the rice husks to the cement plant.
- CO₂ emission reduction is only related to the CO₂ emission generated by fuel burning requirement and not by decarbonisation of raw material.
- The methodology is applicable only for the <u>currently</u> installed <u>capacity</u> capacity that exit by the time of validation. The installed capacity has been validated on site based on the original designed capacity supported by suppliers' documents and has been cross-checked with the Best Demonstrate Practice of 2005. <u>presented below</u>. Here below the installed capacity per plant.

| Bulacan Plant | (BL) | : 5'500 tonnes of clinker/day |
|---------------------|------|-------------------------------|
| Lugait Plant Line 2 | (LG) | : 4'000 tonnes of clinker/day |
| Davao Plant | (DV) | : 3'500 tonnes of clinker/day |

• The amount of alternative fuels available is at least 1.5 times the amount required to meet the consumption of all users consuming the same alternative fuels.

The alternative fuels to be used in the project activity, i.e., agricultural waste (mainly rice husk) and sorted municipal solid waste (MSW), are available in abundance in the Philippines. The table below shows that the estimated amount of rice husk available in each region is more than 9 times the amount proposed to be used by the project activity. The official data on availability of rice husk, coconut waste and bagasse as well as the data on sorted MSW (mainly plastic) are presented in Appendix 1. The CDM country guide for

the Philippines also confirms that there is abundant supply of biomass in the Philippines and that the amount is increasing.

| Availability of the main alternative fuels proposed to be used in the project activity | ty. |
|--|-----|
|--|-----|

| HPHI plants | Rice husk Average of rice husk proposed to be used by he project per year during the crediting period (t) | Rice husk Official availability ¹ in the region per year (t) |
|--------------|--|--|
| Bulacan (BL) | 62,827 | 705,808 |
| Lugait (LG) | 50,763 | 573,010 |
| Davao (DV) | 41,906 | 373,702 |

¹Source: Philippine Bureau of Agricultural Statistics / computed at 15% of the total palay rice husk volume. See details in appendix 1.

To support the official data, HPHI has conducted during the stakeholder's meetings and in the following weeks, an additional investigation in order to know the alternative usage of the rice husk and therefore to determine the net availability including all other users. A form was given to owners of rice mills. The percentage which is either landfilled (no distinction of anaerobic, aerobic or stockpiled), burned in open air, used for fertilizer, brought to companies, sent to haulers, used as fuel, given or used as food to animal was asked. The investigation has been done on a limited number of rice mills owners, the most active one in term of rice husk utilization and therefore the investigation is highly conservative. An update of the investigation will be done during verification. The investigation gives a conservative overview of the current practice in each region. In combination with the official data, an estimation of the net amount available (taking out the amount consumed by other users) is possible. As written above, the survey is very conservative due to the limited amount of rice mill's owners which are the active one and therefore we consider that the amount available is the amount that will be either landfilled, burned in open air and the amount which is already sent to HPHI. The table below resumes the investigation which is available in detail per region and rice mill owners. The number of rice mills'owners is indicated.

Investigation on the current practice of rice husk disposal

Taking into account the amount available as only the amount sent to uncontrolled landfill and the amount burned in open air the percentage are:

| HPHI plants | Rice husk Number of rice mills owners asked during the investigation | Rice husk % sent to uncontrolle dlandfill (no distinction) | Rice husk % burned in open air | Rice husk Amount available in compariso n with the amount proposed to be used |
|--------------|---|--|--------------------------------------|---|
| | | Amount available | Amount available | |
| Bulacan (BL) | 25 53 | 16 53% | 0% | <mark>1.2x5.9x</mark> |
| Lugait (LG) | 4 | 22% | 21% | <mark>1.8x</mark> 4.9x |
| Davao (DV) | 1432 | 3164 % | +7% | <mark>1.5x6.3x</mark> |

As the investigation is very conservative and take into account only active rice mills' owner, we can combined the official source and the investigation and conclude that for Bulacan 16-53% means 112,929t374,078t available therefore 1.8x5.9x, for Lugait 43% means 246,394t therefore 4.9x and for Davao 3271% means 119,585265,328-t therefore 2.9x6.3x. The availability in each region is more than 1.5 time the amount to be used by all users.

The distances are:

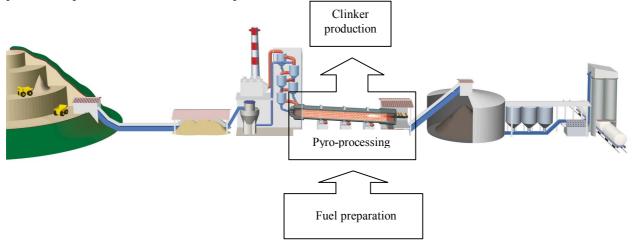

| HPHI plants | Distance from the existing furthest suppliers to the plant (km) |
|--------------|---|
| Bulacan (BL) | 40 150 |
| Lugait (LG) | 159 |
| Davao (DV) | 200 |

page 12

B.3. Description of the sources and gases included in the project boundary

The figure below shows the cement manufacturing process. The physical project boundary covers all production processes related to clinker production.

The table below shows that CO₂ emissions from the fuel combustion, fuel transportation and fuel preparation are considered for the purpose of calculating project emissions and baseline emissions.

| | Source | Gas | Included? | Justification / Explanation |
|------------------|----------------|------------------|-----------|---|
| | | CO ₂ | YES | Direct emissions from firing the kiln and |
| | | | | processing |
| le | | CH_4 | NO | CH4 emissions from combustion processes |
| elir | Kiln fuel use | | | are considered negligible and excluded |
| Baseline | KIIII IUEI USE | | | because these emissions by the cement |
| 8 | | | | industry are negligible (see WBCSD / WRI |
| | | | | Cement protocol) |
| | | N ₂ O | NO | see CH ₄ |
| | | CO ₂ | YES | Direct emissions from firing the kiln and |
| ~ | | | | processing (including supplemental fuels |
| vity | | | | used in the precalciner) |
| ctiv | | CH ₄ | NO | CH4 emissions from combustion processes |
| Project activity | Kiln fuel use | | | are considered negligible and excluded |
| | | | | because these emissions by the cement |
| | | | | industry are negligible (see WBCSD / WRI |
| | | | | Cement protocol) |
| | | N ₂ O | NO | see CH ₄ |

| On site | CO ₂ | YES | Direct emissions due to AF transportation |
|----------------|------------------|-----|---|
| transportation | | | and indirect emissions from fossil fuels |
| and | | | combustion of power plants from the grid |
| preparation of | | | due to electricity used. |
| alternative | CH_4 | NO | NO CH ₄ emission |
| fuels | N ₂ O | NO | NO N ₂ O emission |

Additional emissions included in the project activity as leakage are:

- Emissions (CO₂) from off site transportation of alternative fuels (reduction of fossil fuels transportation are neglected to be conservative).
- Emissions (CO₂) from off site preparation of alternative fuels.

B.4. Description of how the <u>baseline scenario</u> is identified and description of the identified baseline scenario:

>>

Baseline scenario selection

Baseline scenario 1: Utilization of fossil fuels based on global agglomerate data from 2002, 2003 and 2004 level.

Utilization of fossil fuel is the common practice in the cement industry in the Philippines. The Cement Manufacturers Association of the Philippines (CeMAP¹) doesn't publish details of the fuel portfolio of its members. CeMAP report however identifies coal (and the origin or source) as the fossil fuel use in the cement industries. The historical data of HPHI from 2002, 2003 and 2004 is available in the annual technical report and is presented in the calculation data sheet.

| Fuel | Percentage (%) Baseline 1 |
|--|---------------------------|
| Coal | 82.4 |
| Anthracite | 9.8 |
| Petcoke | 6.4 |
| Heavy oil | 1.1 |
| Light oil/ Diesel | 0.0 |
| Waste oil | 0.0 |
| Industrial waste originating from fossil | 0.3 |
| sources | 0.5 |
| Emission factor (tCO2/TJ) | 95.04 |

Baseline 1 is a global average of 2002 to 2004 HPHI's fuel portfolio.

The global emission factor of the baseline 1 is 95.05-04 tCO2/TJ.

¹ www.**cemap**.org.ph

page 14

Baseline scenario 21a: Utilization of fossil fuels based on plant specific agglomerate data from 2002, 2003 and 2004 level.

As each plant has a slightly different fuel portfolio, therefore a second baseline based on plant specific fossil fuels used is proposed.

Below is scenario 2, "Utilization of fossil fuels based on plant specific agglomerate data from 2002, 2003 and 2004 level.":

| Fuels | Percentage (%) | Percentage (%) | Percentage (%) |
|-------------------------|----------------|----------------|----------------|
| | Baseline 2 | Baseline 2 | Baseline 2 |
| | Bulacan | Lugait | Davao |
| Coal | 79.6 | 84.2 | 83.3 |
| Anthracite | 18.6 | 1.7 | 11.0 |
| Petcoke | 0.0 | 12.5 | 5.2 |
| Heavy oil | 0.9 | 1.5 | 0.5 |
| Light oil/ Diesel | 0.1 | 0.0 | 0.0 |
| Waste oil | 0.0 | 0.1 | 0.0 |
| Industrial waste | 0.8 | 0.0 | |
| originating from fossil | | | 0.0 |
| sources | | | |
| Emission factor | 95.09 | 94.69 | 95.22 |
| (tCO2/TJ) | 75.07 | 74.07 | 73.22 |

The baseline 2 presented above is more accurate than the baseline scenario 1 as the specific emission factor of each plant is used.

Baseline scenario 2: likely evolving fuel mix

The table below indicates the foreseen price in PhP of fossil fuels per MJ as per the forecast of 2006. The price includes the FOB and the freight. The detail of the forecast is presented in Annex E- Fuel price. The last shipment of Petcoke was received in 2005. Indeed, the use of petcoke is not foreseen anymore mainly due to the high sulphur concentration in comparison with the price². The consumption of heavy oil and diesel is used only to start the kiln as it is expensive fuels. The consumption will remain more less the same as planned and unplanned stoppages of the kiln don't change much over the years. The local coal Semirara from the Philippines is not always available and the quality is lower than the one from Indonesia. Anthracite from vietnam will most likely remain use as in the previously year on occasional basis.

Bulacan

| Price (Php/MJ) | 2006 | 2007 | 2008 | 2009 | 2010 |

| Price (Php/MJ) | 2006 | 2007 | 2008 | 2009 | 2010 |
| Coal indo (Indonesia) | 0.1189 | 0.1244 | 0.1358 | 0.1491 | 0.1639 |
| Coal semirara (Philippines) | 0.0870 | 0.0910 | 0.0992 | 0.1087 | 0.1194 |
| Anthracite (Vietnam) | 0.1326 | 0.1388 | 0.1517 | 0.1666 | 0.1833 |

The tables above show that the fuel price of coal and anthracite is very similar. However the Indonesian coal has a higher quality and it is available. Therefore we can consider that any fuel switch will be in favour of coal from Indonesia.

Regarding the price and availability analysis above, the fuel mix scenario would most likely be the same than scenario 1a but instead of petcoke, coal would be used.

| Fuels | Percentage (%) | Percentage (%) | Percentage (%) |
|--|----------------|----------------|----------------|
| | Baseline 2 | Baseline 2 | Baseline 2 |
| | Bulacan | Lugait | Davao |
| Coal | 79.6 | 96.7 | 88.5 |
| Anthracite | 18.6 | 1.7 | 11.0 |
| Petcoke | 0.0 | 0.0 | 0.0 |
| Heavy oil | 0.9 | 1.5 | 0.5 |
| Light oil/ Diesel | 0.1 | 0.0 | 0.0 |
| Waste oil | 0.0 | 0.1 | 0.0 |
| Industrial waste originating from fossil sources | 0.8 | 0.0 | 0.0 |
| Emission factor (tCO2/TJ) | 95.09 | 94.33 | 95.08 |

Scenario 2 - likely evolving fuel mix portfolios

page 16

Baseline scenario 3: Fossil fuels are partially substituted with alternative fuels (i.e the proposed CDM project activity)

The third scenario is the project activity, i.e., utilization of fossil fuels plus a significant amount of alternative fuels (AF).

As there are no legal incentives nor obligations for cement companies to use alternatives fuels such as agricultural waste or sorted municipal waste, cement plants will not, most likely, shift from the use of fossil fuels to alternative fuels.

In 2004, HPHI had discussion during the annual Energy Technology Conference (ETC 2004) held in Mandaluyong city in the Philippines on the potential to develop a project activity using alternative fuels under the Clean Development Mechanism. The speakers under the CDM projects and applications' panel were consulting HPHI on the process and potential of such a project (see letter from ENPAP).

In 2005, with the incentives of potential CDM revenues, tests using agricultural by-products as alternative fuels were conducted using manual installations. Aside from rice husks tested in Bulacan, waste carbon (coconut carbon) coming from a supplier's large stockpile was tested in Davao (see letter from the environmental management bureau of Davao city).

Since the first test in Bulacan in 2005, the local and corporate AFR technical team are studying the process behaviour and technical barriers to be overcome to ensure that production losses are minimized and the quality of the clinker is not compromised. With technical support from corporate office and with investments on new alternative fuel facilities, HPHI would partially replace fossil fuels with alternative fuels, using a significant amount of biomass. With the CDM incentives, it is estimated that 15% and 3.8% of the fossil fuel requirements will be replaced by biomass and sorted MSW, respectively. The thermal substitution rate has been estimated by taking into account the technical barriers to be overcome using the tools developed by Holcim on minimizing production losses and maintaining the clinker characteristics. These estimates will be re-evaluated during the verification stage.

| HPHI | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 | 2017-8 |
|----------------------|-------------------|--------------------|--------------------|--------|--------|----------------|--------|--------|--------|---------------|
| Coal | 75.4 8 | 70.4 75 | 64.6 70 | 64.6 | 64.6 | 64.6 | 64.6 | 64.6 | 64.6 | 64.6 |
| | 0.2 | .4 | .4 | | | | | | | |
| Anthracite | 11.0 | 10.9 | 10.9 | 10.9 | 10.9 | 10.9 | 10.9 | 10.9 | 10.9 | 10.9 |
| Petcoke | 4.10. | 0.04 .1 | 0.04.1 | 0.04.1 | 0.04.1 | 0.04 .1 | 0.04.1 | 0.04.1 | 0.04.1 | 0.04 1 |
| | 0 | | | | | | | | | |
| Heavy oil | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 |
| Light oil /Diesel | 0.1 | 0.1 | 0.1 | 0.1 | 0.1 | 0.1 | 0.1 | 0.1 | 0.1 | 0.1 |
| Waste oil | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Industrial waste | 0.4 | 0.4 | 0.4 | 0.4 | 0.4 | 0.4 | 0.4 | 0.4 | 0.4 | 0.4 |

| Below is HPHI's fuel mix com | position for the proposed | project activity (average | e for all 3 plants): |
|------------------------------|---------------------------|---------------------------|----------------------|
| | | | |

| Agricultural waste | 6.0 | 10.00 | 15.00 | 15.00 | 15.00 | 15.00 | 15.00 | 15.00 | 15.00 | 15.00 |
|--------------------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Sorted MSW | 2.00 | 3.00 | 3.8 | 3.8 | 3.8 | 3.8 | 3.8 | 3.8 | 3.8 | 3.8 |

Since the amount of fossil fuel replacement by alternative fuels is slightly different for each plant, separate emission reduction calculations are done for each plant and are given in the calculation sheet as well as in section B.6.3.

Baseline scenario selection

Option 2: Select baseline scenario through barriers analysis

| Alternative scenario | Investment barriers | Technological barriers | Barriers due to prevailing practices | Other barriers |
|-------------------------|---|---|--|---|
| Scenario 1 and 1a | No initial capital investment required. | No technological barriers. | This is the prevailing practice | No |
| Scenario 2 | No initial capital investment required | No technological barriers. The plant will operate with this scenario in the absence of the project activity and the emission factor is more conservative. | This is the prevailing practice | No |
| Scenario 3 | Capital investment | A number of trials have been done (mainly in Bulacan) and are still required for the proposed project activity to optimize the feeding of alternative fuels by keeping the clinker characteristics. New facilities and upgrades of some technical components are required. | Operators are not familiar with handling and feeding of alternative fuels and specific installations have to be developed. | The use of alternative fuels reduces the production capacity. |

Based on the above barriers analysis, scenario 2 is most likely to happen in the absence of the proposed project activity. Therefore, scenario 2 is selected as the baseline scenario. The data for the baseline estimation are taken from the annual technical report (ATR) of the 3 HPHI's cement plants i.e. Davao, Lugait and Bulacan.

| Description of the selected baseline | | | | |
|--------------------------------------|----------------|----------------|----------------|--|
| Fuels | Percentage (%) | Percentage (%) | Percentage (%) | |
| | Baseline 2 | Baseline 2 | Baseline 2 | |

page 18

| | Bulacan | Lugait | Davao |
|--|---------|--------|-------|
| Coal | 79.6 | 96.7 | 88.5 |
| Anthracite | 18.6 | 1.7 | 11.0 |
| Petcoke | 0.0 | 0.0 | 0.0 |
| Heavy oil | 0.9 | 1.5 | 0.5 |
| Light oil/ Diesel | 0.1 | 0.0 | 0.0 |
| Waste oil | 0.0 | 0.1 | 0.0 |
| Industrial waste originating from fossil sources | 0.8 | 0.0 | 0.0 |
| Emission factor (tCO2/TJ) | 95.09 | 94.33 | 95.08 |

| Fuels | Percentage (%) | Percentage (%) | Percentage (%) |
|--|------------------|------------------|------------------|
| | Baseline 2 | Baseline 2 | Baseline 2 |
| | Bulacan | Lugait . | Davao |
| Coal | 79.6 | 84.2 | 83.3 |
| Anthracite | 18.6 | 1.7 | 11.0 |
| Petcoke | 0.0 | 12.5 | 5.2 |
| Heavy oil | 0.9 | 1.5 | 0.5 |
| Light oil/ Diesel | 0.1 | 0.0 | 0.0 |
| Waste oil | 0.0 | 0.1 | 0.0 |
| Industrial waste originating from fossil sources | 0.8 | 0.0 | 0.0 |
| Emission factor (tCO2/TJ) | 95.09 | 94,69 | 95.22 |

B.5. Description of how the anthropogenic emissions of GHG by sources are reduced below those that would have occurred in the absence of the registered CDM project activity (assessment and demonstration of additionality): >>

The tool for the demonstration and assessment of additionality version 3 has been used.

The incentives of CDM were undeniably considered in the decision to proceed with the proposed project activity. Discussions have started in October 2004 regarding the technological feasibility and the administrative procedures. In 2005, with the belief in CDM incentives, manual tests and trials have started. The Energy Efficiency Practioners Association of the Philippines who has followed the progress of HPHI in this matter has confirmed the various steps (see letter). Today, HPHI is still in the industrial testing phase as only limited installations (one conveyor) have been implemented in Bulacan and manual feeding is done in Lugait and Davao. The CEO will allow engineering works to overcome the technological barriers which have been pointed out to reach the level proposed once the project will be registered.

STEP 1. Identification of alternatives to the project activity consistent with current laws and regulations.

Sub-step 1a. Define alternatives to the project activity:

Three alternatives have been discussed above to select the most plausible baseline scenario. Alternative 2 is the most probable scenario for the following reasons: it is the prevailing practice, it is technically the most feasible scenario and it does not seek any investment. In addition, in comparison to scenario 1, it is the most specific scenario.

Alternative 3 is the project activity and it is not the most plausible scenario as there are major technical barriers, investment barriers, production losses plus maintenance issues. The barriers associated with the use of the alternative fuels proposed in the project activity are enumerated below.

Sub-step 1b. Consistency with mandatory laws and regulations:

All alternatives are in compliance with applicable laws and regulations.

Step 2. Investment analysis

Option III "Benchmark analysis" is the more relevant analysis method as the financial indicator is compared with the standard return of the company and of the market and not to a specific project type

like the Option II "Comparison analysis". The option I "Simple cost analysis" is relevant only if the project activity doesn't generate any other benefit than the CDM income and therefore doesn't apply for

the project activity.

Sub-step 2b. – Option III Apply benchmark analysis

Since scenario 1, 1a and 2 don't seek investment, the investment analysis is done only on scenario 3 which is the proposed project. A proposal of an investment plan is in study by the process engineers and has been part of the validation process to determine the prohibitive nature of the technological barriers. Here below an overview of the proposal by plant.

In order to assess the potential investment, although post 2010 is not defined, an investment comparison analysis has been calculated with the investment plan proposal (annex B – investment plan) and the fin plan fuel forecast of 2006. The draft investment analysis shows that the proposed investment would lead to a negative IRR without CER and to an IRR of about 28% with CER. As the usual rate for investment of HPHI is 13.8%, the comparison confirms that HPHI needs the CER to overcome the barrier and go on with the installations. In any case, this value is a conservative estimation as the totality of the needed installations and process modifications are not yet finalized. The analysis will be reviewed once the project is registered and the final investment plan completed and accepted. The table below shows the summary of the IRR calculation. The details have been added in the revised PDD version 03.

It was assessed during the validation on site that HPHI is in the starting phase of the project activity with limited usage of biomass and non continuous feeding. The barriers are highly prohibitive as they required an optimization of the process which can only be overcome with iterative trials regarding the process as well a customized installations regarding the handling of biomass. The bottlenecks have been presented and assessed by the DOE as well as the proposition of investment. Indeed, the various steps will lead to significant investment.

Step 3. Barrier analysis

Step 3. Barrier analysis is selected

Step 3a. Identify barriers that would prevent the implementation of the type of the proposed project activity

UNFCCC

. 1.

page 23

The use of alternative fuels in the cement kiln is not yet well-established in the Philippines. Hence, this project will likely face major barriers and risks which, without the CDM benefits, would prevent HPHI from its implementation. These barriers are discussed as follows.

Technological barriers

There are mainly 2 types of technological barriers when using alternative fuels. These are the direct one, due to the feeding of the alternative fuels, and the indirect one, caused by the process in regard to keeping production losses minimum and maintaining the clinker characteristics within regulatory standards.

Using alternative fuels in a power plant to generate electricity is different from using one in a kiln. In a power plant, the alternative fuels are burned directly and the heat produced is used to generate electricity. In a cement kiln, the alternative fuels come directly in contact with the raw materials that are used to produce the clinker. In the process, the mineral components of the alternative fuels, in addition to the heat, are recovered and becomes part of the clinker. For this reason, optimizing the use of alternative fuel is a case by case study which, depending on the type of kiln used and the characteristics of the raw materials, may vary from kiln to kiln. To ensure that the clinker characteristics are not compromised, all parameters that could influence the clinker features need to be considered and solutions to mitigate whatever impacts implemented. Holcim Philippines, with the supporting tools developed by Holcim Group Support Ltd such as the fuel mix optimizer (FMO) and low grade fuel study, has identified all bottlenecks and process limitations of each cement plant for the successful implementation of the project activity (shown during validation).

The detailed analyses of the 3 plants have allowed HPHI to set up 3 specific road maps regarding the current project activity. Some of the indirect issues that have been identified and needed to be addressed for each of the 3 plants when using alternative fuels (demonstrated with the tools during validation) are: a) high variation in the quality of the main fuel and limestone, b) high percentage of calcination, c) very low burner momentum, and d) very low oxygen level at the kiln inlet. Technical solutions have been proposed, addressing each issue one at a time. As this is a learning process, a team reviews and analyzes all process conditions anew in order to fully understand the consequence of any modification or solution implemented. The appendix 4 shows the details of the bottleneck analysis as well as one example of the fuel mix optimizer.

Some of the direct technological barriers related to the use of alternative fuel are: a) the receiving area of the materials, b) safe and proper handling of the materials, c) variation in the characteristics of the materials, d) high moisture content, and e) proper AFR feeding facility to be able to reach the target reduction in fossil fuel.

In 2006, part of the project activity industrial tests, a feeding system, consisting of a hopper and conveyor to transport biomass to the calciner, was installed in Bulacan plant. Since then, many modifications have been (and are still being) made in order to optimize the system. The industrial tests show that the process of feeding alternative fuels is more challenging compared to using traditional fuels. For one, alternative fuels are not homogeneous and therefore, are technically more difficult to feed. They have lower calorific value, higher moisture content and lower density than traditional fuels. Consequently, a higher volumetric feed rate is needed, resulting in jamming and instability in the process. To attain the target thermal substitution,

the feeding and handling facility in Bulacan has to be improved. Further, a dosing system has to be installed to regulate the introduction of alternative fuels. Although Holcim Bulacan plant has a designated receiving concrete area, a covered storage will have to be considered, especially during the rainy season.

For the cement plants in Davao and Lugait, alternative fuels are for now fed manually into the kiln using basic handling equipment. A hoist is used to transport the materials from ground level to preheater and the materials are then manually fed into the "feeding point" protected by a double-flap gate. An improved feeding and handling system and covered storage area have to be set-up for each of these 2 plants also to attain to desired thermal substitution rate.

Hazards and corresponding mitigating measures have been identified and safe working procedures have been developed to ensure proper handling of alternative fuels. Improvement in the procedures and continuous training of employees on specific methods and other safety measures is ongoing.

Additional informations

The project activity involves the setting up of the indirect technical barriers as well as several new infrastructures such as feeding systems (conveyor, hoppers, etc.), covered designated area to receive the alternative fuels, controlling and monitoring devices, and safety equipment. Equipment, as well as installation and commissioning activities, entail upfront cost. Taking into account CDM incentives, HPHI has since 2006 invested around PhP1 million in AFR facilities to achieve the industrial tests. Once the project will be registered, HPHI will dedicate a team to analysis further more the direct and indirect technical barriers that have been shown and will propose solution with the related cost. Once solution will be set, an investment plan will be done and presented to the CEO as so far the CEO didn't accept any more investment without registration.

Besides direct investment, the project activity will generate indirect costs resulting from consultancy, training, monitoring, and maintenance of the equipment and cost of additional personnel.

Further, indirect costs related to losses in clinker production as a result of increased use of alternative fuels have to be taken into account as a barrier to the proposed activity. The clinker production loss is estimated using the fuel mix optimizer and was demonstrated during the validation.

Barriers due to prevailing practice

The use of a significant amount of alternative fuels in clinker production is not the current practice in the Philippines. Fossil fuels are the preferred choice and therefore the prevailing practice within the cement industry. The representative of the Philippine DNA has confirmed that it does not have any similar project for validation so far. It is aware though that another company has been considering CDM incentives.

Sub-step 3b. Show that the identified barriers would not prevent the implementation of at least one of the alternatives (except the proposed project activity)

In the case of the baseline scenario 1 and 2, they would not face the barriers associated with the proposed project activity. It is currently the prevailing practice and the technical barriers are business as usual. The table above evaluates all alternatives and shows that alternative 2 is the most probable scenario.

Step 4 Common practice analysis

Sub-step 4a. Analyze other activities similar to the proposed project activity

The use of significant amounts of alternative fuels is not the current practice in the cement manufacturing industries in the Philippines. Based on information from the Cement Manufacturers Association of the Philippines (CeMAP), coal is the major source of thermal energy in the local cement industry.

Sub-step 4b. Discuss any similar options that are occurring

With the major barriers (investment, production losses, technological issues and prevailing practice standards) and lack of incentives available, the proposed project activity or similar projects are not likely to happen without the Clean Development Mechanism incentives.

The step approach shows that the project is additional.

Impact of CDM Registration

The CDM allows HPHI to overcome the barriers related to the substitution of fossil fuels with alternative fuels.

CDM status provides many key benefits to HPHI

- Prospect of CDM revenue and decrease of the financial risk
- Significant reduction of the GHG emissions
- CDM revenue will encourage HPHI (and even other Holcim Group companies) to come up with new ideas and projects reducing GHG emissions
- Gain of experience in CDM projects

The cement industry is aware of the CO2 emissions associated with clinker production and CDM provides real incentives encouraging the industry to reduce CO2 emissions by using alternative fuels. The key benefits cited allow not only HPHI, but as well as the other Holcim Group of Companies, to dedicate financial and technical resources to overcome the barriers.

B.6. Emission reductions:

| B.6.1 . | Explanation of methodological choices: | |
|----------------|--|--|
| | | |

>>

Details of the calculation choices are shown in section B.6.2 "Data and parameters available at validation" and section B.7.1 "Data and parameters monitored".

Below are the main methodological choices:

- Waste fuel and industrial waste originating from fossil fuels are part of the baseline and the related heat input and emissions are computed within the fossil fuel calculation.
- Emissions saving from reduction of on site transport of fossil fuels are not taken into account
- Emission savings from reduction in the preparation of fossil fuels are not taken into account.
- Leakages due to biomass residues that would be burned in the absence of the project activity or landfill in an uncontrolled manner are not taken into account.
- Leakage due to reduced off-site transport of fossil fuel is not taken into account.

B.6.2. Data and parameters that are available at validation:

All data used to calculate the baseline and estimate of the project activity emissions reduction are available. The baseline data are presented in this section. The project activity data (estimation) is part of the monitoring data and presented in section B.7.

The data and parameters are taken from the annual technical report (ATR), a report that each plant within the Holcim group completes and submits to the Corporate every January of the year.

Since the values applied are not always the same for the 3 plants, the abbreviation of each plant is given when necessary.

| Data / Parameter: | C _{Bl} |
|-------------------------|---|
| Data unit: | Tonne |
| Description: | Annual production of clinker |
| Source of data used: | Annual technical report |
| Value applied: | See calculation database |
| Justification of the | Quantity of clinker produced. |
| choice of data or | |
| description of | Daily production monitoring based on clinker factor multiplied by weight of kiln |
| measurement methods | feed. Daily usage of kiln feed is obtained from kiln feed weight totalizer readings |
| and procedures actually | while clinker factor is obtained using a drop test. |
| applied : | Cross- check with automatic weight system of the cement grinding input and |
| | clinker sold. |
| | ISO 9001:2000. |
| Any comment: | None |

| Data / Parameter: | Q _{FF,BA} coal |
|----------------------|--|
| Data unit: | Tonne |
| Description: | Quantity of fossil fuel (coal) used in the baseline |
| Source of data used: | Annual technical report |
| Value applied: | BL:145,644 LG: 175,366201,448 DV:110,391117,617 |
| Justification of the | The amount of each fossil fuel is automatically daily weighted with the weight |
| choice of data or | totalizer of the bin and cross-checked with the delivery and inventory. |

B.6.3 Ex-ante calculation of emission reductions:

>>

Step 1. Project heat input from alternative fuel

$$HI_{AF} = \Sigma Q_{AF} \times HV_{AF}$$

Where:

 HI_{AF} = heat input from alternative fuels (TJ/yr)

 Q_{AF} = quantity of each alternative fuel (tonnes/yr)

 HV_{AF} = lower heating value of the alternative fuel(s) used (TJ/tonne fuel).

Step 2. Estimation of the project specific moisture "penalty"

 $MP_y = C_{Pr,y} \times (HC_{AF} - HC_{FF})$

Where:

 MP_y = moisture penalty (TJ/yr) for year y

 $C_{Pr,y}$ = is the clinker production for year y

 HC_{AF} = is the specific fuel consumption on project case (TJ/tClinker) in year y

 HC_{FF} = is the specific fuel consumption in the baseline when only fossil fuel is used, in TJ/tClinker.

| HC _{FF} | 0.00331 | | | | | | | | | |

Step 3 GHG emissions from the use of alternative fuels in kilns:

 $AF_{GHG} = \Sigma(Q_{AF} * HV_{AF} * EF_{AF})$

Where:

 AF_{GHG} = GHG emissions from alternative fuels (tCO2e/yr)

 Q_{AF} = monitored alternative fuels input in clinker production (tonnes/yr).

 HV_{AF} = heating value(s) of the alternative fuel(s) used (TJ/tonne fuel).

 EF_{AF} = emission factor(s) of alternative fuel(s) used (tCO₂e/TJ).

 CO_2 emissions from burning biomass residues are CO_2 -neutral assuming that the generation of the biomass residues occurs independently of the project activity.

 CO_2 emissions from waste originating from fossil sources in the specific case sorted MSW could be CO_2 neutral if it can be clearly demonstrated that the heat would not be used for energy purposes without the project activity.

The heating value is estimated today at 0.02TJ/t (lab analysis shown during validation). It will be reviewed when receiving sorted MSW. The IPCC 2006 estimates the emission factor of municipal solid waste (non biomass fraction) at 91.7 tCO2/TJ and tyres at 143tCO2/TJ. In order to be conservative an estimation of the potential emission from sorted MSW has been calculates with 143t CO2/TJ in the table below.

| | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 | 2017-8 |
|----|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| BL | 15,702 | 23,639 | 39,567 | 39,567 | 39,567 | 39,567 | 39,567 | 39,567 | 39,567 | 39,567 |
| LG | 12,887 | 19,430 | 19,538 | 19,538 | 19,538 | 19,538 | 19,538 | 19,538 | 19,538 | 19,538 |
| DV | 10,642 | 16,046 | 16,128 | 16,128 | 16,128 | 16,128 | 16,128 | 16,128 | 16,128 | 16,128 |

Step 4 Baseline GHG emissions from the fossil fuel(s) displaced by the alternative fuel(s)

 $FF_{GHG} = [(Q_{AF} \times HV_{AF}) - MP_{total}] \times EF_{FF}$

Where:

| FF _{GHG} | = GHG emissions from fossil fuels displaced by the alternatives (tCO_2/yr) |
|-----------------------------|--|
| $Q_{AF} \times HV_{AF}$ | = total actual heat provided by all alternative fuels (TJ/yr) |
| MP _{total} | = total moisture penalty (TJ/yr) |
| $\mathrm{EF}_{\mathrm{FF}}$ | = emissions factor(s) for fossil fuel(s) displaced (t CO_2/TJ). |

 EF_{FF} is the estimated baseline value and would be the lowest of the following CO2 emission factors: - the weighted average annual CO2 emission factor for the fossil fuel(s) consumed and monitored ex ante during the year before the validation,

- the weighted average annual CO2 emission factor for the fossil fuel(s) consumed and monitored during the corresponding verification period (e.g. the period during which the emission reductions to be certified have been achieved),

- the weighted average annual CO2 emission factor for the fossil fuel(s) that would have been consumed according to the baseline scenario determined in section 1 and 2 of the "Additionality and baseline scenario selection".

For the estimation of the present calculation, the weighted average annual CO2 emission factor for the fossil fuels consumed and monitored ex ante during the year before the validation has been used. This value is also the weighted average annual CO2 emission factor for the fossil fuels that would have been consumed according to the baseline scenario.

Step 5. GHG emissions due to on-site transportation and drying of alternative fuels

$$\begin{split} OT_{GHG} &= OF_{AF} \times (VEF_CO_2 + VEF_CH_4 \times GWP_CH_4/1000 + VEF_N_2O \times GWP_N_2O/1000) + (FD \times FD_HV \times VEF_D) + OP_{AF} \times EF_{op} \end{split}$$

Where:

| where. | |
|----------------------|--|
| OT _{GHG} | = GHG emissions from on-site transport and drying of alternative fuels (tCO_2e/yr) |
| OF _{AF} | = transportation fuel used for alternative fuels on-site during the year (t/yr), |
| VEF_CO_2 | = CO_2 emission factor for the transportation fuel (t CO_2 /tonne), |
| VEF_CH_4 | = CH_4 emission factor for the transportation fuel (kg CH_4 /tonne), |
| VEF_N ₂ O | = N_2O emission factor for the transportation fuel (kg N_2O /tonne), |
| GWP_CH_4 | = global warming potential for CH_4 (21), |
| GWP_N ₂ O | = global warming potential for N_2O (310), |
| FD | = fuel used for drying alternative fuels (t/yr) , |
| FD_HV | = heating value of the fuel used for drying $(TJ/t \text{ fuel})$ |
| | |

page 35

| VEF _D | = emission factor of the fuel used for drying (tCO_2/TJ) |
|------------------|--|
| OP _{AF} | = Power consumption in transporting alternative fuel (MWh) |
| EF _{op} | = CO_2 emission factor due to power generation (t CO_2 /MWh) |

The GHG emission generated by the use of conveyors to carry the alternative fuels is computed in this section. The CO_2 emission factor due to power generation (t CO_2/MWh) is based on the tool to calculate the emission factor for an electricity system - Annex 12 EB 35 (step 6 combined margin). The data stems from the official guidebook CDM baseline construction for the electricity grids in the Philippines which has been published in 2006. No more recent data were available when writing the latest version of the PDD. The data will be updated during verification.

Step 6. Emission savings from reduction of on-site transport of fossil fuels

364

364

364

364

364

364

364

364

 $OT_GHG_{FF} = OF_{FF} \times EF_{T CO2e}$

249

128

| Where: | |
|---|---|
| OT-GHG _{FF} | = emissions from reduction of on-site transport of fossil fuels (tCO_2e) |
| OF_{FF} | = fuel saving from on-site transportation of fossil fuels (t/yr) |
| $\mathrm{EF}_{\mathrm{T}\mathrm{CO2e}}$ | = emission factor of fuel used for transportation (tCO ₂ e/t fuel) |
| | |

For conservativeness, the emissions savings are not computed.

364

Leakage

OT_{GHG}

Step 1. CH₄ emissions due to biomass residues that would be burned in the absence of the project

 $BB_{CH4} = Q_{AF-B} \times BCF \times CH_4F \times CH_4/C \times GWP_CH_4$

| Where: | |
|--------|--|
|--------|--|

| BB_{CH4} | = GHG emissions due to burning of biomass residues used as alternative fuel (tCO_2e/yr) |
|---------------------|---|
| Q _{AF-B} | = amount of biomass residues used as alternative fuel that would have been burned in the |
| | open field in the absence of the project (t/yr) |
| BCF | = carbon fraction of the biomass residue (tC/t biomass) estimated on basis of laboratory |
| | analysis (0.30) |
| CH ₄ F | = fraction of the carbon released as CH_4 in open air burning (expressed as a fraction) |
| CH ₄ /C | = mass conversion factor for carbon to methane (16 tCH ₄ /12 tC) |
| GWP_CH ₄ | = global warming potential of methane (21). |
| _ | |

Since the Republic Act 9003 or the Ecological Solid Waste Management Act of 2000 prohibits the open burning of all agricultural waste in open air, the related GHG emission reductions are not claimed.

Step 2. Calculate the CH₄ emissions due to anaerobic decomposition of biomass residues at landfills

$$LW_{CH4,y} = \mathbf{\phi} \times 16/12 \times F \times DOC_{f} \times MCF \times \Sigma \Sigma QAFL_{j,x} \times DOC_{j} \times (1 - e^{-kj}) \times e^{-kj} \times NFL \times GWP_{CH4}$$

Where:

| Willer C. | |
|-----------------------------|---|
| LW _{CH4,y} | = Baseline GHG emissions due to anaerobic decomposition of biomass residues in landfills during the year y (tCO2e/yr) |
| | |
| QAFL _{j,x} | = amount of biomass residues of type j used as alternative fuel that would be landfilled in |
| | the absence of the project in the year $x (t/yr)$ |
| Φ | = Model correction factor (default 0.9) to correct for the model-uncertainties |
| F | = Fraction of methane in the landfill gas (default value 0.5) |
| DOCi | = Percent of degradable organic carbon (by weight) in the biomass type j |
| $\mathrm{DOC}_{\mathrm{f}}$ | = Fraction of DOC dissimilated to landfill gas (default value 0.77) |
| MCF | = Methane Correction Factor (fraction) (default value 0.4 for unmanaged site) |
| \mathbf{k}_{j} | = Decay rate for the biomass residue stream type j (default value 0.023) |
| j | = is biomass residue type distinguished into the biomass residue categories |
| X | = year during the crediting period: x runs from the first year of the first crediting period |
| | (x=1) to the year for which emissions are calculated $(x=y)$ |
| у | = year for which LFG emissions are calculated |
| NFL | = the non-flared portion of the landfill gas produced (%) (100%) |
| | |
| GWP _{CH4} | = Global warming potential valid for the relevant commitment period |
| | |

For conservativeness, the related GHG reductions are not claimed.

Step 3. Calculate emissions from off-site transport of alternative and fossil fuels

$$\begin{split} LK_{trans} &= LK_{AF} - LK_{FF} \\ LK_{AF} &= (Q_{AF}/CT_{AF}) \times D_{AF} \times EF_{CO2e}/1000 \\ LK_{FF} &= (RQ_{FF}/CT_{FF}) \times D_{FF} \times EF_{CO2e}/1000 \end{split}$$

Where:

- LK_{trans} = leakage from transport of alternative fuel less leakage due to reduced transport of fossil fuels (tCO₂/yr)
- LK_{AF} = leakage resulting from transport of alternative fuel (tCO₂/yr)
- LK_{FF} = leakage due to reduced transport of fossil fuels (tCO₂/yr)
- Q_{AF} = quantity of alternative fuels (tonnes)
- CT_{AF} = average truck or ship capacity (tonnes/truck or ship)
- D_{AF} = average round-trip distance between the alternative fuels supply sites and the cement plant sites (km/truck or ship)
- RQ_{FF} = quantity of fossil fuel (tonnes) that is reduced due to consumption of alternative fuels estimated as:
- CT_{FF} = average truck or ship capacity (tonne /truck or ship)
- D_{FF} = average round-trip distance between the fossil fuels supply sites and the cement plant sites (km/truck or nautical mile/ship)
- EF_{CO2e} = emission factor from fuel use due to transportation (kg CO₂e/km) estimated as:
- $EF_{CO2e} = EF_{T CO2} + (EF_{T CH4} \times 21) + (EF_{T N2O} \times 310)$

Where:

- $EF_{T CO2}$ = emission factor of CO₂ in transport (kg CO₂/km)
- $EF_{T CH4}$ = emission factor of CH_4 in transport (kg CH_4 /km)
- $EF_{T N2O}$ = emission factor of N₂O in transport (kg N₂O/km)
- 21 and 310 are the Global Warming Potential (GWP) of CH4 and N2O respectively

To be conservative, leakage due to reduced transport of fossil fuel is not taken into account.

Step 4. Emissions from off-site drying (and preparing) of alternative fuels

 $GHG_{PAFO} = FD_{AFO} \times HV_{FDAFO} \times EFF_{DAFO} + PD_{AFO} \times EF_{pO}$

Where:

- GHG_{PAFO} = GHG emissions that could be generated during the preparation of alternative fuels outside the project site (tCO₂/yr)
- FD_{AFO} = fuel used in drying of alternative fuels outside the project site (t/yr)
- HV_{FDAFO} = heating value of fuel used for drying alternative fuels outside the project site (TJ /tonne)
- EFF_{DAFO} = emission factor for the fuel used for drying of alternative fuels outside the project site (tCO₂/TJ)
- PD_{AFO} = power consumption in drying the alternative fuels (MWh/yr) outside the project site
- $EF_{pO} = CO_2$ emission factor due to power generation outside the project where the drying of

page 39

alternative fuels takes place.

A small amount of the agricultural waste is shredded in Lugait and therefore PD_{AFO} is replaced by power consumption (MWh/yr) used to prepare the alternative fuels outside the project site.

| Lugait | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 |

page 40

Emission Reductions

Total emission reductions are given by the following formula:

 $\begin{array}{ll} AF_{ER} = FF_{GHG} - AF_{GHG} - OT_{GHG} - LK_{trans} + OT_GHGFF + BB_{CH4} + LW_{CH4,y} - GHG_{PAFO} \\ \\ Where: \\ FF_{GHG} & = GHG \ emissions \ from \ fossil \ fuels \ displaced \ by \ the \ alternatives \ (tCO_2/yr) \\ AF_{GHG} & = GHG \ emissions \ from \ alternative \ fuels \ (tCO_2e/yr) \\ OT_{GHG} & = GHG \ emissions \ from \ on-site \ transport \ and \ drying \ of \ alternative \ fuels \ (tCO_2e/yr) \\ LK_{trans} & = \ leakage \ from \ transport \ of \ alternative \ fuel \ less \ leakage \ due \ to \ reduced \ transport \ of \ fossil \ fuels \ (tCO_2/yr) \\ OT-GHGFF & = \ emissions \ from \ reduction \ of \ on-site \ transport \ of \ fossil \ fuels \ (tCO_2e) \\ \end{array}$

 BB_{CH4} = GHG emissions due to burning of biomass residue that is used as alternative fuel (tCO₂e/yr)

LW_{CH4,y} = baseline GHG emissions due to anaerobic decomposition of biomass residues at landfills (tCO₂e/yr)

 $GHG_{PAFO} = GHG$ emissions that could be generated during the preparation of alternative fuels outside the project site (tCO₂/yr)

B.7 Application of the monitoring methodology and description of the monitoring plan:

B.7.1 Data and parameters monitored:

All data used to calculate the project activity emissions reduction are available at verification stage. The values of data applied for each year of the crediting period are reported either automatically into the SAP system (global computerized system) or recorded in a logbook. Depending on the value, the record is done in continuous, daily or monthly. The measurement interval is mentioned in the table below under the description of the measurement method. Most of the data are then reported in the Annual Technical Report (ATR), which is the official document controlled by the corporate. Any additional information which is not in the ATR will be collected in a logbook. In the case of any erroneous measurement, a note will be done in the logbook and/or will be reported in the ATR under the section "comment".

The values which stem from external sources (for example values coming from IPCC) will be updated according to the source's publication. The data stemming from HPHI transport database and from geographical parameters will be updated, if needed, throughout the duration of the project activity.

All HPHI cement plants are ISO 9001:2000 and ISO 14001 accredited. Therefore, the uncertainty level of the data is relatively low. The quality control (QC) and quality assurance (QA) also includes cross-checking of data from other reports within the Holcim Group. The reliability and accuracy of the data depends on the equipment used. The equipment are subject to regular maintenance and calibration and can be validated during the verification stage. The monitoring data will be kept for at least 2 years after the end of the crediting period.

Most of the values applied for the purpose of calculating expected emission reductions are defined in section B.6.3 Ex-ante calculation of emission reductions.

Step 6

Monitoring emission saving from reduction of on site transport of fossil fuels Not computed for conservativeness.

Leakage

Step 1

Monitoring CH4 emissions due to biomass residues that would be burned in the absence of the project

Not computed for conservativeness.

UNFCCC

Step 2

Monitoring CH4 emissions due to anaerobic decomposition of biomass residues at landfills Not computed for conservativeness.

Step 3 Monitoring emissions from off-site transport of alternative and fossil fuels

B.7.2 Description of the monitoring plan:

>>

Most of the data are already collected in the annual technical report (ATR). To facilitate internally the monitoring process, a specific report (project activity CDM database) will be prepared. Further, to ensure accurate, reliable and easily accessible data for the project emission reduction calculation, the report will also include information on the following

- Method of collection and reporting of data
- Periodic analysis of traditional and alternative fuels by in-house and accredited 3rd party
- Regular monitoring of operating parameters
- Equipment used to measure, monitor & control usage of traditional and alternative fuels
- Equipment used to analyze quality of traditional and alternative fuels
- Laboratory methods and procedures in the analysis

• Regular maintenance and calibration of equipment by in-house and accredited 3rd party

The SVP for Manufacturing, responsible for the CDM project, has assigned a team to be responsible for the overall monitoring and specific reporting of the project activity. The same team will likewise be responsible for the collection and monitoring of all relevant data, including transportation of the alternative fuels to the cement plant.

B.8 Date of completion of the application of the baseline study and monitoring methodology and the name of the responsible person(s)/entity(ies)

>>

1518/0309/2008

Holcim Philippines Ltd: Maria Rosario Chan, CDM Project team Holcim Group: Bruno Vanderborght, Catherine Martin-Robert

The two entities above are the project participants. Contact information is available in Annex 1.

SECTION C. Duration of the project activity / crediting period

C.1 Duration of the <u>project activity</u>:

C.1.1. Starting date of the project activity:

>>

The project activity has started in January 2005 with tests and trials.

C.1.2. Expected operational lifetime of the project activity:

>>

15 years

C.2 Choice of the <u>crediting period</u> and related information:

C.2.1. <u>Renewable crediting period</u>

Not applicable for the project activity.

| C.2.1.1. | Starting date of the first crediting period: |
|----------|--|
| | |

>>

| C.2.1.2. | Length of the first <u>crediting period</u> : |
|----------|---|
| | |

>>

C.2.2. Fixed crediting period:

| C.2.2.1. | Starting date: |
|----------|----------------|
| | |

>>

page 58

01/06/2008

C.2.2.2.

Length:

10 years

SECTION D. Environmental impacts

>>

>>

D.1. Documentation on the analysis of the environmental impacts, including transboundary impacts:

>>

As mentioned, the environmental management system of the 3 cement plants of HPHI is ISO14001 certified. This means that HPHI has undertaken a systematic review of the key environmental impacts of its operations, has identified appropriate management and monitoring measures of these impacts, and has undertaken a regular management review of its environmental performance.

While HPHI is responsible for compliance with local regulatory environmental standards such as the Philippine Clean Air Act, it is also subject to the Holcim Group Emissions Monitoring and Reporting Standard, which, amongst others, requires the installation of a continuous emissions monitoring equipment for specific air pollutants such as dust, SO₂, NOx and VOC and the (at least) annual spot measurement of a range of stack gas emission parameters by an accredited third party. Stack gas emission results, along with other environmental data and information, are collated and reported annually in a standard format to Holcim Group Support in Switzerland. The results are benchmarked across the Group. Regional and plant management receive feedback on their environmental performance.

In 2005, the quality, environment and safety management systems of all the plants have been integrated. The ISO/IMS certification together with the Holcim Group Emissions Monitoring and Reporting Standards provide a safety net of proactive measures, to ensure that the use of alternative fuels is environmentally safe for the community,

D.2. If environmental impacts are considered significant by the project participants or the <u>host</u> <u>Party</u>, please provide conclusions and all references to support documentation of an environmental impact assessment undertaken in accordance with the procedures as required by the <u>host Party</u>:

>>

The project is in full compliance with all local regulatory standards, including the Philippine Clean Air, and with international standards including those set by the Alternative Fuels and Raw Materials Group of Holcim Corporate.

An Environmental Impact Statement (EIS) was submitted by Holcim Philippines, Inc. (then known as Union Cement Corporation, UCC for La Union, Bulacan and Davao, and Alsons Cement Corporation for Lugait) to the Department of Environment and Natural Resources - Environmental Management Bureau (DENR-EMB) in connection with its application for an amendment of its Environmental Compliance Certificate (ECC) allowing its cement plants to use various agricultural and industrial wastes as alternative

fuels for its kiln operation. Environmental impacts were predicted and corresponding mitigating measures were identified during the various stages of the project. As part of the EIS process, consultation meetings with various stakeholders were conducted to ensure that their concerns and suggestions were appropriately taken. An Environmental Management Plan was likewise developed for the project.

SECTION E. Stakeholders' comments

>>

E.1. Brief description how comments by local <u>stakeholders</u> have been invited and compiled: >>

As a responsible corporate member dedicated to sustainable development, Holcim Philippines' plan to use alternative fuels in its kiln systems has been communicated to identified stakeholders.

Meetings have been done with various stakeholders at barangay and municipal level in November 2006 for Bulacan and Lugait, and in March 2007, for Davao. Identified stakeholders involved local impacted communities, local government units, non-government and government organizations and suppliers of agricultural wastes. A public notice in the local newspapers of each region has been published indicating the major line of the project activity and informing that a stakeholders' meeting will be held. In addition specific invitations have been sent to identified stakeholders.

| Millers/Farmers | | | |

Participants' attendance in each region

In the meeting, HPHI representatives discussed causes and impacts of global warming, increasing waste disposal problem in the Philippines, Kyoto protocol, details of the project on use of alternative fuels such as agricultural by-products and industrial wastes in HPHI cement plants, and the benefits associated with the project.

| E.2. Summary of the comments received: |
|--|
|--|

>>

The stakeholders' meetings have allowed the participants to understand the concepts related to climate change issues, its link with the Kyoto Protocol and the details the project undertaken by Holcim Philippines on the use of alternative fuels.

The stakeholders have recognized the positive environmental impacts of the project. During discussions, the efficiency of the cement kiln technology in co-processing alternative fuels had been well-communicated to the participants, as well as the proper procedures in the waste handling, receiving and feeding to ensure the safety of all concerned. The major issues raised were the economic gains of the communities and suppliers of alternative fuels.

The stakeholders have expressed their satisfaction and appreciation of the project, not only as a tool for efficient waste management, but also in helping mitigate climate change. The project was regarded as a win-win partnership between HPHI and stakeholders. It was viewed favourably due to the anticipated benefits in terms of providing long-term solution to the waste management and in helping improve local and global environmental conditions.

A write-up of each meeting is available. A summary of concerns and measures to address it is listed in annex.

E.3. Report on how due account was taken of any comments received:

>>

All comments and issues raised were documented. HPHI is committed to a continuous Information, Education, Communication (IEC) program to update stakeholders and to sustain appreciation and deepen awareness about environment protection and conservation.

Appendix 2

Grid emission factor calculations

REF: Tool to calculate the emission factor for an electricity system

(The complete calculation sheets have been shown during validation)

Luzon-Visayas grid emission factor

Step 1. Identify the relevant electric power system

Bulacan plant is connected to the Luzon-Visayas grid.

Step 2. Select an operating margin (OM) method

The simple OM has been chosen as the low cost must run resources constitute less than 50% of the total grid generation.

Step 3 and 4. Calculate the operating margin emission factor according to the selected method and identify the cohort of power units to be included in the build margin

Appendix 3

Stakeholders' Meeting : Summary of Issues and Concerns and proposed measures to address them

Holcim Philippines Bulacan Plant

What are the benefits to the community of using alternative fuel?

The implementation of the project shall require manpower and thus, shall be a source of additional income to the farmers, millers and other members of the community. Project stakeholders, supported by Holcim know how shall be able to enhance their capabilities in handling, proper health and safety practices. The use of alternative fuels results in the reduction of GHG thus resulting in an improvement of the climate and therefore our life quality.

What is the specific role of Holcim and the community in the undertaking?

Holcim, as a responsible company, is proactive and participates in project that protects the climate and support sustainable development of the country. The community is part of the project as the opportunities giving by the project bring a win-win situation.

How can the schools/institutions with MRF participate in the project?

The main objective of this initiative is the reduction of GHG emission, in particular CO2. CO2 results from burning. By taking the current project as an example and educating the Schools/institutions, they can help reduce GHG emission by applying waste hierarchy in the treatment of their wastes. As much as possible, the practice of open burning of wastes should be eliminated. Schools can teach their students the importance of proper segregation of wastes – reuse and recycle wastes that can still be of value. Wastes that cannot be recycled nor reused, provided it will not harm the environment, product quality, process and safety can then go to cement plant as alternative fuel.

What is the economic return to the rice millers if they will supply the rice husks that will be used as alternative fuel in the cement processing?

During the milling season, in order to have more storage space, rice husks are usually landfilled in an uncontrolled manner or openly burned in the fields by rice millers. With this project, economic incentives to cover transportation and labor costs will be given to rice millers/farmers when the rice husks are brought to Holcim. In addition, there will be employment opportunities (direct and indirect) during the construction of the facilities and operation of the project.

Holcim Philippines La Union Plant

What is the purpose and goal of implementing this project?

Holcim implements this project to help in the global effort of reducing emissions of CO2 that cause climate change and to reduce the use of coal which is non-renewable.

What are the materials that will qualify as AFR for this project?

Because of the abundance of agricultural by products and the current waste problems in the Philippines, the project will primarily use these waste materials (sorted MSW and the agricultural by- products) to reduce the use of fossil fuels.

What is the incentive of the rice millers and the community in providing the materials that will be used as AFR?

During the milling season, in order to have more storage space, rice husks are usually landfilled in an uncontrolled manner or openly burned in the fields by rice millers. With this project, economic incentives to cover transportation and labor costs will be given to rice millers/farmers when the rice husks are brought to Holcim. In addition, there will be employment opportunities (direct and indirect) during the construction of the facilities and operation of the project.

How can the project help mitigate climate change if it will also require burning the rice husks and plastics?

Mitigation of climate change takes place first because of the reduction in the corresponding GHG that would have been emitted if coal was used as the fuel in the cement process. Second, in open burning, the heat generated is lost to the atmosphere and methane, as well as dust particles, are released. Third by landfilling the biomass, methane is alsol released. In the cement kiln, the heat generated by the rice husks and plastics is now recovered by the kiln system and replaces the heat that would have been been supplied by coal. GHG emission coming from coal is therefore not released. Further, the methane that would have been released if the rice husks were landfilled are not released.

How can you prove that emissions coming from the cement plant have no harmful effects to the impacted community?

HPHI ensures that it complies with the standards set, not only by local regulators but also by international agencies. Test runs have already been conducted showing that the use of these alternative materials does not impact the quality of the product, process, health & safety, and the environment. In additions, annual emission measurement is conducted by an accredited 3rd party. HPHI plants have CEMS that continuously monitor the emission of inorganic pollutants from the stack. These results are submitted to EMB and are available to the public. In addition to providing a sustainable solution to the waste problem, Holcim can help in subsidizing the transport

In what ways can Holcim assist the LGU?

In addition to providing a sustainable solution to the waste problem, Holcim can help in subsidizing the transport collection of the segregated wastes from an MRF to its cement plant. In can also assist the LGUs in information and education campaign on sustainable development such as solid waste management.

Holcim Philippines Lugait Plant

What are the materials that will qualify as alternative fuels for this project?

Because of the abundance of agricultural by-products and the current waste problems in the Philippines, sorted municipal solid waste and the agricultural by products will be the major materials used as alternative fuel.

What is the incentive of the rice millers and the community in providing the materials that will be used as AFR?

During the milling season, in order to have more storage space, rice husks are usually landfilled in an uncontrolled manner or openly burned in the fields by rice millers. With this project, economic incentives to cover transportation and labor costs will be given to rice millers/farmers when the rice husks are brought to Holcim. In addition, there will be employment opportunities (direct and indirect) during the construction of the facilities and operation of the project.

How can this project help in mitigating climate change if it will also require burning?

Mitigation of climate change takes place first because of the reduction in the corresponding GHG that would have been emitted if coal was used as the fuel in the cement process. Second, in open burning, the heat generated is lost to the atmosphere and methane as well as dust particulates, are released. Third by landfilling the biomass, methane is also released. In the cement kiln, the heat generated by the rice husks and plastics is now recovered by the kiln system and heat that would have been supplied by coal is not needed. Its GHG emissions are not released. Methane, as well as dust particulates, that would have been released by burning in open air or landfilling are not released.

How can you prove that emissions coming from the cement plant have no harmful effects to the impacted community?

HPHI ensures that it complies with the standards set, not only by local regulators but also by international agencies. Test runs have already been conducted showing that the use of these alternative materials does not impact the quality of the product, process, health & safety, and the environment. In additions, annual emission measurement is conducted by an accredited 3rd party. HPHI plants have CEMS that continuously monitor the emission of inorganic pollutants from the stack. These results are submitted to EMB and are available to the public.

What is the objective of implementing this project?

Holcim implements this project in support of the global effort to reduce emissions of CO2 that cause climate change and to reduce the use of coal which is non-renewable.

In what ways can Holcim assist the LGU in the collection of waste?

Holcim can help in subsidizing the transport collection of the segregated wastes from an MRF to its cement plant. It can also assist the LGUs in the information and education campaign on sustainable development such as solid waste management.

What will be the role of the LGU to help in this project?

LGUs play a very important role in this project, especially in the implementation of proper segregation of solid wastes / in accordance to Solid Management Waste Act. It can help ensure that wastes are properly segregated and only those that cannot be recycled nor reuse then goes to the MRF for final disposal to Holcim

What are the potential effects of utilizing alternative fuel?

Test runs have been conducted and the results showed that there are no negative impacts when using agricultural byproducts and sorted MSW in the cement kilns to reduce the use of fossil fuels. The following safeguard measures are inplace to ensure that risks are managed well when these materials : a) stack gas emissions are measured by 3rd party accredited laboratory / Continuous Emission Monitoring System, b) product quality is regularly checked, and c) process conditions are regularly monitored.

What are the benefits that will be given to the contributors of alternative fuels?

First and foremost will be the improvement in the environmental condition of the people. Contributors or suppliers of alternative fuels will have additional income. For example, during the milling season, in order to have more storage space, rice husks are usually dumped or left to decay or openly burned in the fields by rice millers. With this project, economic incentives to cover transportation and labor costs will be given to rice millers/farmers when the rice husks are brought to Holcim. In addition, there will be employment opportunities (direct and indirect) during the construction of the facilities and during operation of the project.

Why are hospital wastes cannot be accepted as alternative fuels?

Holcim follows strictly its protocol in the use of any materials as alternative fuels. There are specific wastes that are known to pose danger either to the process or the health and safety of the people. For hospital wastes, the main issue is the safe handling of such materials.

What is the transportation scheme for the materials that will be collected?

A subsidy will be given to cover the transportation cost of the materials and labor costs.

Holcim Philippines Davao Plant

How much is the economic return to the rice millers if they will give the rice husks that will be used for the project?

It is difficult to state at this point how much would be the economic return to the rice millers. The current practice during the milling season is to burn the rice husks, in order to free up some space, or to landfill it in an uncontrolled manner. With this project, economic incentives to cover transportation and labor costs will be given to rice millers/farmers when the rice husks are brought to Holcim. In addition, there will be employment opportunities (direct and indirect) and investment opportunities during the construction of the facilities and operation of the project.

What are the materials that will qualify as alternative fuels for this project?

Because of the abundance of agricultural by products and the current waste problems in the Philippines, the project will primarily use these waste materials (sorted MSW and the agricultural by- products) to reduce the use of fossil fuels.

Is Holcim legally compliant if alternative fuels will be used in the system?

Yes. Holcim is compliant to all regulations. It has its ECC amended allowing it to use alternative fuels to replace coal in the manufacture cement.

What is the operating scheme to implement the collection of municipal wastes and rice husk that will give incentives to the community?

Holcim can subsidize the cost of transporting the rice husks and municipal wastes from the community to its cement plant. What is more important however is that the community has now, by implementing proper segregation of its waste and in accordance to the Solid Management Waste Act, has a sustainable solution to its waste problem. Details of how this will be operationalized can be further discussed.

Is it possible that Holcim will help in the collection of wastes to ease the dues of the community they pay for the garbage collection?

Holcim may help by subsidizing the collection of the segregated wastes from an MRF to its cement plant. LGU on the other hand can help by ensuring that wastes are properly segregated and only those that cannot be recycled nor reused then goes to the MRF.

What is the guarantee that the emissions produced by implementing this project are safe?

HPHI ensures that it complies with the standards set, not only by local regulators but also by international agencies. Test runs have already been conducted showing that the use of these alternative materials does not impact the quality of the product, process, health & safety, and the environment. In additions, annual emission measurement is conducted by an accredited 3rd party. HPHI plants have CEMS that continuously monitor the emission of inorganic pollutants from the stack. These results are submitted to EMB and are available to the public.
