

EB 65 Report Annex # Page 1

#### **Draft revision** to the methodological tool

"to determine methane emissions avoided from disposal of waste at a solid waste disposal site"

"Emissions from solid waste disposal sites"

(Version **06.0.0**)

#### I. **DEFINITIONS, SCOPE, APPLICABILITY AND PARAMETERS**

#### **Definitions**

For the purpose of this tool, the following definitions apply:

**Managed SWDS.** A SWDS that has controlled placement of waste (i.e. waste directed to specific deposition areas, a degree of control of scavenging and a degree of control of fires) and will include at least one of the following: (i) cover material; (ii) mechanical compacting; or (iii) leveling of the waste. In this tool, a SWDS that does not meet this definition is considered an unmanaged SWDS.

**Municipal solid waste (MSW).** A heterogeneous mix of different solid waste types, usually collected by municipalities or other local authorities. MSW includes household waste, garden/park waste and commercial/institutional waste.

**Residual waste.** A solid waste type with largely homogenous properties. This includes, inter alia, material that remains after the waste is treated, e.g. anaerobic digestate and compost, and biomass residues (byproduct, residue or waste stream from agriculture, forestry and related industries).

**Solid waste.** Material that is unwanted and insoluble (including gases or liquids in cans or containers). Hazardous waste is not included in the definition of solid waste. Solid waste may include residual wastes.

**Solid waste disposal site (SWDS).** Designated areas intended as the final storage place for solid waste. Stockpiles are considered a SWDS if (a) their volume to surface area ratio is 1.5 or larger and if (b) a visual inspection by the DOE confirms that the material is exposed to anaerobic conditions (i.e. it has a low porosity and is moist).

**Stockpile.** A pile of solid waste (not buried below ground). Anaerobic conditions are not assured in a stockpile with low volume to surface area ratios (less than 1.5) because the waste may be exposed to higher aeration.

#### Scope and applicability

This tool provides procedures to calculate baseline, project or leakage emissions of methane from solid waste that, in the absence of the project activity, would be disposed or prevented from disposal at solid waste disposal sites (a SWDS).

EB 65 Report Annex # Page 2

The tool can be used to determine emissions for the following types of applications:

- Application A: The CDM project activity mitigates methane emissions from a specific existing SWDS. Methane emissions are mitigated by capturing and flaring or combusting the methane (e.g. ACM0001). The methane is generated from waste disposed in the past, including prior to the start of the CDM project activity. In these cases, the tool is only applied for an *ex-ante* estimation of emissions in the CDM-PDD. The emissions will then be monitored during the crediting period using the applicable approaches in the relevant methodologies (e.g. measuring the amount of methane captured from the SWDS).
- Application B: The CDM project activity avoids or involves the disposal of waste at a SWDS. An example of this application of the tool is AM0025, in which MSW is treated with an alternative option, such as composting or anaerobic digestion, and is then prevented from being disposed of in a SWDS. The methane is generated from waste disposed or avoided from disposal during the crediting period. In these cases, the tool can be applied for both *ex-ante* and *ex-post* estimation of emissions.

These two types of applications are referred to in the tool for determining parameters.

In the case that (a) different types of residual waste are disposed or prevented from disposal or that (b) both MSW and residual waste(s) are prevented from disposal, then the tool should be applied separately to each residual waste and to the MSW.

The tool is not applicable to stockpiles. Emission reductions are calculated with a first order decay model. The tool is applicable in cases where the solid waste disposal site where the waste would be dumped can be clearly identified. The tool is not applicable to hazardous wastes.

#### **Parameters**

This tool provides procedures to determine the following parameters:

Parameter	SI Unit	Description	
BE <sub>CH4,SWDS,y</sub>	t CO <sub>2</sub> e / yr	Baseline, project or leakage mMethane emissions occurring in year y	
$PE_{CH4,SWDS,y}$		avoided during the year y from preventing generated from waste	
LE <sub>CH4,SWDS,y</sub>		disposal at the solid waste disposal site a SWDS during a time period	
		ending in year y (where y is a period of 12 consecutive months)	
$BE_{CH4,SWDS,m}$	t CO <sub>2</sub> e / m	Baseline, project or leakage methane emissions occurring in month m	
$PE_{CH4,SWDS,m}$		generated from waste disposal at a SWDS during a time period ending	
$LE_{CH4,SWDS,m}$		in month m	

In this context, stockpiles are solid waste disposal sites where anaerobic conditions are not ensured because they are exposed to higher aeration due to a larger surface area to volume ratio, or because their permanence cannot be ensured, for example waste can be easily moved from one place to another or is subject to the risk of incidental fires. The approach to determine emissions from stockpiles as described in AMS-III.E cannot be used for large scale project activities.

#### II. BASELINE METHODOLOGY PROCEDURE

#### Procedure to determine methane emissions from the SWDS

In the absence of the project activity, be  ${}^{t}$ The amount of methane that would be generated from disposal of waste at the SWDS ( ${}^{t}$ BE<sub>CH4,SWDS,y</sub>) is calculated with a multi-phase model. The calculation is based on a first order decay (FOD) model. The model differentiates between the different types of waste j with respectively different respective constant decay rates  $\binom{k_j}{j}$  and different fractions of degradable organic carbon  $\binom{DOC_j}{j}$ .  ${}^{t}$ The model calculates the methane generation occurring in year  $\binom{t}{j}$  (a period of 12 consecutive months) or month  $\binom{t}{j}$  based on the actual waste streams of waste types  $\binom{t}{j}$  ( $W_{j,x}$  or  $W_{j,i}$ ) disposed in the SWDS over a specified time period (years or months). In each year  $\frac{t}{j}$ , starting with the first year after the start of the project activity until the until the end of the year  $\frac{t}{j}$ , for which baseline emissions are calculated (years  $\frac{t}{j}$  with  $\frac{t}{j}$  to  $\frac{t}{j}$ .

In cases where at the SWDS methane is captured (e.g. due to safety regulations) and flared, combusted or used in another manner that prevents emissions of methane to the atmosphere, the baseline emissions are adjusted for the fraction of methane captured  $(f_v)$  at the SWDS<sub>3</sub>.

The amount of methane produced generated from disposal of waste at the SWDS is calculated for in the year y ( $BE_{CH4,SWDS,y}$ ) is calculated ( $BE_{CH4,SWDS,y}$  or  $PE_{CH4,SWDS,y}$  or  $PE_{CH4,SWDS,y}$ ) using equation (1) or for month m ( $BE_{CH4,SWDS,m}$  or  $PE_{CH4,SWDS,m}$ ) using equation (2) as follows. The basis selected (yearly or monthly calculation) must be consistent during the project and should be documented in the CDM-PDD. All data used to apply the equations should be documented transparently in CDM-PDD or the monitoring reports. The CDM-PDD should also clearly specify the time period (the consecutive years x or months i) in which waste disposal is considered in the calculation. For application A, this time period may begin before the start of the project activity and typically starts when the SWDS starts receiving waste. For application B, only waste disposed of or avoided from the disposal after the start of the first crediting period shall be considered and, hence, the time period shall not start earlier than the start of the first crediting period of the proposed CDM project activity.

The emissions are calculated as follows:

$$BE_{CH4,SWDS,y} = \varphi \cdot (1-f) \cdot GWP_{CH4} \cdot (1-OX) \cdot \frac{16}{12} \cdot F \cdot DOC_{T} \cdot MCF \cdot \sum_{x=1}^{y} \sum_{j} W_{j,x} \cdot DOC_{j} \cdot e^{-k_{j} \cdot (y-x)} \cdot (1-e^{-k_{j}})$$

$$(1)$$

$$\begin{vmatrix}
BE_{CH4,SWDS,y} \\
PE_{CH4,SWDS,y} \\
LE_{CH4,SWDS,y}
\end{vmatrix} = \varphi_{y} \cdot (l - f_{y}) \cdot GWP_{CH4} \cdot (l - OX) \cdot \frac{16}{12} \cdot F \cdot DOC_{f,y} \cdot MCF_{y} \cdot \sum_{x=1}^{y} \sum_{j} W_{j,x} \cdot DOC_{j} \cdot e^{-k_{j} \cdot (y-x)} \cdot (l - e^{-k_{j}})$$
(1)

$$\frac{\text{BE}_{\text{CH4,SWDS,m}}}{\text{PE}_{\text{CH4,SWDS,m}}} = \varphi_y \cdot \left(1 - f_y\right) \cdot \text{GWP}_{\text{CH4}} \cdot \left(1 - \text{OX}\right) \cdot \frac{16}{12} \cdot \text{F} \cdot \text{DOC}_{f,m} \cdot \text{MCF}_y \cdot \sum_{i=1}^{m} \sum_{j} W_{j,i} \cdot \text{DOC}_j \cdot e^{\frac{k_j}{12}(m-i)} \cdot \left(1 - e^{\frac{k_j}{12}}\right) \cdot \left(1 - e^{$$

As an approximation, methane generation in the SWDS is described as a function of time according to a first order decay process with rapid, moderate and slow degrading organic fractions distinguished.

EB 65 Report Annex# Page 4

#### Where, for the yearly model:

$BE_{CH4,SWDS,y}$	= Baseline, project or leakage methane emissions occurring in year y generated from
$PE_{CH4,SWDS,y}$	waste disposal at a SWDS during a time period ending in year y (t CO <sub>2</sub> e / yr)
$LE_{CH4,SWDS,y}$	

= Years in the time during the crediting period in which waste is disposed at the SWDS, extending from the first year in the time period (x = 1) to year y (x = y).: x runs from the first year of the first crediting period (x = 1) to the year y until year y for which avoided emissions are calculated (x = y).

> = Year of the crediting period for which methane emissions are calculated (y is a consecutive period of 12 months)

 $DOC_{f_{\mathbf{v}}}$ = Fraction of degradable organic carbon (DOC) that <del>can</del> decomposes under the specific conditions occurring in the SWDS for year y (weight fraction)

= Amount of organic solid waste type j disposed or prevented from disposal in the  $W_{i,x}$ SWDS in the year x (tons)

#### Where, for the monthly model:

$BE_{CH4,SWI}$	OS,m =	Baseline, project or leakage methane emissions occurring in month m generated from		
PE <sub>CH4,SWE</sub>		waste disposal at a SWDS during a time period ending in month $m$ (t CO <sub>2</sub> e / m)		
LE <sub>CH4,SWI</sub>	OS,m			
<mark>m</mark>		Month of the crediting period for which methane emissions are calculated		
<mark>i</mark>	=	Months in the time period in which waste is disposed at the SWDS, extending from the		
		first month in the time period $(i = 1)$ to month $m$ $(i = m)$		
$\overline{\mathrm{DOC}_{\mathrm{f,m}}}$	=	Fraction of degradable organic carbon (DOC) that decomposes under the specific		
		conditions occurring in the SWDS for month m (weight fraction)		
$\mathbf{W}_{::}$	_	Amount of organic waste type i disposed/prevented from disposal in the SWDS in the		

#### And, where for both the yearly and monthly models:

month *i* (t)

<del>Φ</del> φ <sub>ν</sub>	= Model correction factor to account for model uncertainties for year y (0.9)
f <sub>v</sub>	= Fraction of methane captured at the SWDS and flared, combusted or used in another
	manner that prevents the emissions of methane to the atmosphere in year y
$GWP_{CH4}$	= Global Warming Potential (GWP) of methane, valid for the relevant commitment
	<mark>period</mark>
OX	= Oxidation factor (reflecting the amount of methane from SWDS that is oxidised in the
	soil or other material covering the waste)
F	= Fraction of methane in the SWDS gas (volume fraction) (0.5)
MCF <sub>y</sub>	= Methane correction factor for year y
$DOC_j$	= Fraction of degradable organic carbon $\frac{\text{(by weight)}}{\text{(boson)}}$ in the waste type j (weight fraction)
$\mathbf{k}_{j}$	= Decay rate for the waste type $j (1 / yr)$
j	= Type of residual waste or types of waste in the MSW type category (index)

#### Determining the parameters required to apply the FOD model

Table 1 summarizes how the parameters required in this tool can be determined. This includes the use of default values, one time measurements or monitoring throughout the crediting period. The selection of the option that can be used depends on whether the tool is used for application A or B.

#### Table 1: Overview of the option to determine parameters

<b>Parameter</b>	Application A	Application B		
<b>(0</b>	Project or leakage emissions: default values			
<mark>φ<sub>y</sub></mark>	Baseline emissions: default values or project specific value estimated yearly			
$\overline{OX}$	<b>Defaul</b>	t value		
$\mathbf{F}$	Defaul	t value		
$DOC_{f,v}$ or		In the case of MSW: default value or		
$\frac{DOC_{f,y}OI}{DOC_{f,m}}$	<mark>Default value</mark>	estimated once		
DOC <sub>f,m</sub>		In the case of residual waste: estimated once		
		Monitored for SWDS with a water table		
	Default values (based on SWDS type)	above the bottom of the SWDS		
$\frac{MCF_{y}}{MCF_{y}}$		Default values (based on SWDS type) for		
		SWDS without a water table above the		
		bottom of the SWDS		
${f k_j}$	Default values (based on waste type)			
$W_{j,x}$ or $W_{j,i}$	Estimated once	Calculated based on monitored data		
DOC <sub>i</sub>	Default values (based on waste type)	Default values or waste specific value		
DOC <sub>j</sub>	Default values (based off waste type)	estimated once		
${\mathbf{f_y}}$	Estimated once	Monitored		

#### Determining the model correction factor $(\varphi_v)$

The model correction factor  $(\phi_y)$  depends on the uncertainty of the parameters used in the FOD model. If project or leakage emissions are being calculated, then  $\phi_y = \phi_{\text{default}} = 1$ . If baseline emissions are being calculated, then project participants may choose between the following two options to calculate  $\phi_y$ :

#### Option 1: Use a default value

Use a default value:  $\phi_y = \phi_{default}$ . Default values for different applications and climatic conditions are provided in the section "Data and parameters not monitored" below.

#### Option 2: Determine $\varphi_v$ based on specific situation of the project activity

Undertake an uncertainty analysis for the specific situation of the proposed project activity. The overall uncertainty of the determination of methane generation in year  $v(v_y)$  is calculated as follows:

$$\mathbf{v}_{y} = \sqrt{\mathbf{a}^{2} + \mathbf{b}^{2} + \mathbf{c}^{2} + \mathbf{d}^{2} + \mathbf{e}^{2} + \mathbf{g}^{2}}$$

(3)

The factors a, b, c, d, e and g quantify the effect of the uncertainty of different parameters (listed in the second column of Table 2), used in the FOD model, on the overall uncertainty of the methane generation in year y. Project participants shall select for each factor a value within the range provided in Table  $2^2$ , following the instructions in the table, and justify their selection.

<sup>&</sup>lt;sup>2</sup> These uncertainty values are estimated based on the 68% confidence level.

Table 2: Instructions for the selection of values for the factors a, b, c, d, e and g

<b>Factor</b>	<b>Parameter</b>	<b>Lower</b>	<mark>Higher</mark>	<b>Instructions for selecting the factor</b>
		<mark>value</mark>	<mark>value</mark>	
<mark>a</mark>	W	<mark>2%</mark>	10%	Use the lower value if solid waste is weighed
				using accurate weighbridges. Use the higher
				value if the amount of waste is estimated, such
				as from the depth and surface area of an existing
				SWDS
b	$\overline{\mathrm{DOC_{j}}}$	<mark>5%</mark>	10%	Use the lower value if the DOC <sub>j</sub> is measured.
				Use the higher value if default values are used.
c	$\frac{\mathrm{DOC_{f}}}{}$	<mark>5%</mark>	<b>15%</b>	Use the lower value if more than 50% of the
				waste is rapidly degradable organic material or if
				the SWDS is located in a tropical climate.
				Otherwise use the higher value
d	F	<mark>0%</mark>	<mark>5%</mark>	Use the lower value if more than 50% of the
				waste is rapidly degradable organic material.
e	$\frac{MCF_y}{}$	<mark>0%</mark>	<mark>50%</mark>	Use the lower value for managed SWDS. For
				unmanaged SWDS, use the higher value or
				determine the factor as 2/d, where d is the depth
				of the SWDS (in meters)
g	$e^{-k_j\cdot(y-x)}\cdot \left(1-e^{-k_j}\right)$	<mark>5%</mark>	<mark>20%</mark>	The uncertainty values provided express the
				uncertainty for the exponential term as a whole.
				Use the lower uncertainty value in the following
				cases: (i) Application B: if residual waste is
				disposed at the SWDS and if the value of k is
				larger than 0.2 y <sup>-1</sup> ); and (ii) Application A: if the
				SWDS compartments where the project is
				implemented were closed less than 3 years ago.
				In all other cases, use the higher value

 $\varphi_v$  is then calculated as follows:

$$\varphi_{y} = \frac{1}{(1+v_{y})}$$

<mark>(4</mark>)

For the case that the monthly FOD model is being used (equation (2)), then  $\varphi_y$  refers to the year y to which the month m belongs.

Determining the amounts of waste types j disposed in the SWDS ( $W_{i,x}$  or  $W_{i,j}$ )

Where different waste types j are disposed or prevented from disposal in the SWDS prevented from disposal (for example, in the case of MSW), it is necessary to determine the amount of different waste types  $(W_{j,x} \text{ or } W_{j,i})$  through sampling and calculate the mean from the samples. In the case that only one type of waste is disposed (for example, in the case of a residual waste), then  $W_{j,x} = W_x$  and  $W_{j,i} = W_i$  and the following procedures do not need to be applied (e.g. waste sampling is not required).

EB 65 Report Annex # Page 7

#### Application A

Calculate W<sub>j,x</sub> or W<sub>j,i</sub> based on information from the SWDS owner and administration and from interviews with senior employees. The total amount of waste can be calculated from the SWDS surface area and average depth, assuming a specific weight of 1-1.2 t per cubic meter. If the SWDS has distinct compartments and if the amount of waste per compartment and the exploitation period of a compartment is known, then the amounts of waste for a specific series of years can be obtained. Further historic information on amounts, composition and origin of the waste might be found in SWDS administration documents (e.g. contracts with clients and invoices to clients) or obtained from old business plans or business evaluations.

#### Application B

Where different waste types j are prevented from disposal, Determine the amount of different waste types  $(W_{i,x})$  through sampling and calculate the mean from the samples, as follows, either using equation (5) to determine the value of  $W_{i,x}$  for the yearly model or using equation (6) to determine the value of  $W_{j,i}$  for the monthly model, as follows:

$$\frac{\sum_{j,x}^{z} p_{n,j,x}}{W_{j,x} = W_{x} \cdot \frac{n-1}{z}}$$

$$\mathbf{W}_{\mathbf{j},\mathbf{x}} = \mathbf{W}_{\mathbf{x}} \cdot \mathbf{p}_{\mathbf{j},\mathbf{x}} \tag{5}$$

Where:

 $W_{j,x}$  = Amount of organic solid waste type j disposed or prevented from disposal in the SWDS in the year x (tons)

 $W_x$  = Total amount of organic solid waste disposed or prevented from disposal in the SWDS in year x (tons)

 $p_{H_{ij},x}$  = Weight f-Average fraction of the waste type j in the waste sample n collected during the in year x-(weight fraction)

j = Types of solid waste type category (index)

Years in the time period for which waste is disposed at the SWDS, extending from the first year in the time period (x = 1) to year y = (x = y)

$$\mathbf{W}_{\mathbf{j},\mathbf{i}} = \mathbf{W}_{\mathbf{i}} \cdot \mathbf{p}_{\mathbf{j},\mathbf{i}} \tag{6}$$

Where:

 $W_{j,i}$  = Amount of solid waste type j disposed or prevented from disposal in the SWDS in the month i (t)

W<sub>i</sub> = Total amount of solid waste disposed or prevented from disposal in the SWDS in

 $p_{j,i}$  = Average fraction of the waste type j in the waste in month i (weight fraction)

= Types of solid waste

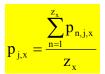

Months in the time period in which waste is disposed at the SWDS, extending from the first month in the time period (i = 1) to month m (i = m)

EB 65 Report Annex# Page 8

The fraction of the waste type j in the waste for the year x or month i are calculated according to equations (7) and (8), as follows:

Where:

Average fraction of the waste type *j* in the waste in year *x* (weight fraction)  $p_{n,j,x}$ 

Fraction of the waste type j in the sample n collected during the year x (weight fraction)

= Number of samples collected during the year x

Samples collected in year x n

= Types of solid waste

= Years in the time period for which waste is disposed at the SWDS, extending from the

first year in the time period (x = 1) to year y(x = y)

$$p_{j,i} = \frac{\sum_{n=1}^{3} p_{n,j,i}}{3}$$

Where:

Average fraction of the waste type *j* in the waste in month *i* (weight fraction)  $\mathbf{p}_{i,i}$  $p_{n,j,i}$ 

= Fraction of the waste type j in the sample n collected during or recent to month i

(weight fraction)

The three most recent samples collected during or previous to month i

Types of solid waste

Months in the time period in which waste is disposed at the SWDS, extending from the first month in the time period (i = 1) to month m (i = m)

Determining the fraction of DOC that decomposes in the SWDS (DOC<sub>fv</sub>)

#### Application A

 $DOC_{f,v}$  is given as a default value ( $DOC_{f,v} = DOC_{f,default}$ ) provided in the section "Data and parameters not monitored" below.

#### Application B

In the case that the tool is applied to MSW, then project participants may choose to either apply a default value (DOC<sub>f,y</sub> = DOC<sub>f,default</sub>) or to determine DOC<sub>f,y</sub> or DOC<sub>f,m</sub> based on measurements of the biochemical methane potential of the MSW (BMP<sub>MSW</sub>), as follows:

EB 65 Report Annex # Page 9

$$DOC_{f,y} = 0.7 \cdot \frac{12}{16} \cdot \frac{BMP_{MSW}}{F \cdot \sum_{j} \left(p_{j,y} \cdot DOC_{j}\right)}$$

<mark>(9</mark>

and

$$DOC_{f,m} = 0.7 \cdot \frac{12}{16} \cdot \frac{BMP_{MSW}}{F \cdot \sum_{j} \left(p_{j,m} \cdot DOC_{j}\right)}$$
(10)

Where:

DOC<sub>f,y</sub> = Fraction of degradable organic carbon (DOC) that decomposes under the specific conditions occurring in the SWDS for year *y* (weight fraction)

 $DOC_{f,m}$  = Fraction of degradable organic carbon (DOC) that decomposes under the specific conditions occurring in the SWDS for month m (weight fraction)

BMP<sub>j</sub> = Biochemical methane potential for the MSW disposed or prevented from disposal (t CH<sub>4</sub> / t waste)

F = Fraction of methane in the SWDS gas (volume fraction)

DOC<sub>j</sub> = Fraction of degradable organic carbon in the waste type j (weight fraction)  $p_{j,m}$  = Average fraction of the waste type j in the waste in year y (weight fraction) Average fraction of the waste type j in the waste in month m (weight fraction)

Types of solid waste in the MSW

Year of the crediting period for which methane emissions are calculated (y is a consecutive period of 12 months)

m = Month of the crediting period for which methane emissions are calculated

In the case that the tool is applied to a residual waste, then project participants shall determine  $DOC_{f,v}$  or  $DOC_{f,m}$  based on measurements of the biochemical methane potential of the residual waste type j (BMP<sub>j</sub>), as follows:

$$DOC_{f,y} = DOC_{f,m} = 0.7 \cdot \frac{12}{16} \cdot \frac{BMP_{j}}{F \cdot DOC_{j}}$$
(11)

Where:

 $DOC_{f,y}$  = Fraction of degradable organic carbon (DOC) that decomposes under the specific conditions occurring in the SWDS for year y (weight fraction)

DOC<sub>f,m</sub> = Fraction of degradable organic carbon (DOC) that decomposes under the specific conditions occurring in the SWDS for month m (weight fraction)

BMP<sub>j</sub> = Biochemical methane potential for the residual waste type j disposed or prevented from disposal (t CH<sub>4</sub> / t waste)

F = Fraction of methane in the SWDS gas (volume fraction)

 $DOC_j$  = Fraction of degradable organic carbon in the waste type j (weight fraction)

= Residual waste type applied to the tool

y = Year of the crediting period for which methane emissions are calculated (y is a consecutive period of 12 months)

m = Month of the crediting period for which methane emissions are calculated

EB 65 Report Annex # Page 10

Procedure to determine the methane correction factor (MCF<sub>v</sub>)

#### Application A

The MCF should be selected as a default value (MCF<sub>y</sub> = MCF<sub>default</sub>) provided in the section "Data and parameters not monitored" below.

#### Application B

In case of a water table above the bottom of the SWDS (for example, due to using waste to fill inland water bodies, such as ponds, rivers or wetlands), the MCF should be determined as follows:

$$MCF_{y} = MAX \left\{ \left( 1 - \frac{2}{d_{y}} \right), \frac{h_{w,y}}{d_{y}} \right\}$$
(12)

Where: MCF<sub>y</sub> h<sub>w,y</sub> d<sub>y</sub>

= Methane correction factor for year y

= Height of water table measured from the base of the SWDS (m)

= Depth of SWDS (m)

In other situations, the MCF should be selected as a default value (MCF $_v$  = MCF $_{default}$ ).

#### Changes required for methodology implementation in 2<sup>nd</sup>-and 3<sup>rd</sup>-crediting periods

At the renewal of the crediting period, the following data should be updated according to default values suggested in the most recently published IPCC Guidelines for National Greenhouse Gas Inventories:

- Oxidation factor (OX);
- Fraction of methane in the SWDS gas (F);
- Fraction of degradable organic carbon (DOC) that can decompose (DOC<sub>t</sub>);
- Methane correction factor (MCF):
- Fraction of degradable organic carbon (by weight) in each waste type j (DOCj);
- Decay rate for waste type  $j(k_t)$ .

Respectively, If the most recent IPCC Guidelines suggest different categorization of waste types, solid waste disposal sites or climate conditions, these should be applied.

EB 65 Report Annex # Page 11

	carbon dioxide This factor reflects the fact that some degradable organic carbon does	
	<del>not degrade, or</del>	
	degrades very slowly, under anaerobic conditions in the SWDS. A default value of	
	<del>0.5 is recommended by IPCC</del>	

Data / Parameter:	DOC <sub>f,default</sub>
Data unit:	Weight fraction
Description:	Default value for the Ffraction of degradable organic carbon (DOC) in MSW that ean decompose decomposes in the SWDS
Source of data:	IPCC 2006 Guidelines for National Greenhouse Gas Inventories
Value to be applied:	0.5
Any comment:	This factor reflects the fact that some degradable organic carbon does not degrade, or degrades very slowly, in the SWDS. This default value can only be used for i) Application A; or ii) Application B if the tool is applied to MSW.  An alternative to using the default factor is to estimate DOC <sub>f,y</sub> or DOC <sub>f,m</sub> using equations (9), (10) and (11) above

Data / Parameter:	MCF <sub>default</sub>		
Data unit:	-		
Description:	Methane correction factor		
Source of data:	IPCC 2006 Guidelines for National Greenhouse Gas Inventories		
Value to be	In case that the SWDS does not have a water table above the bottom of the SWDS		
applied:	and in case of application A, then select the applicable value from the following:		
	<ul> <li>1.0 for anaerobic managed solid waste disposal sites. These must have controlled placement of waste (i.ewaste directed to specific deposition areas, a degree of control of scavenging and a degree of control of fires) and will include at least one of the following: (i) cover material; (ii) mechanical compacting; or (iii) leveling of the waste;</li> <li>0.5 for semi-aerobic managed solid waste disposal sites. These must have controlled placement of waste and will include all of the following structures for introducing air to the waste layers: (i) permeable cover material; (ii) leachate drainage system; (iii) regulating pondage; and (iv) gas ventilation system;</li> <li>0.8 for unmanaged solid waste disposal sites – deep and/or with high water table. This comprises all SWDS not meeting the criteria of managed SWDS and which have depths of greater than or equal to 5 meters;</li> <li>0.4 for unmanaged-shallow solid waste disposal sites or stockpiles that are considered SWDS. This comprises all SWDS not meeting the criteria of managed SWDS and which have depths of less than 5 meters. This includes</li> </ul>		

<del>case of e</del>

CDM - Executive Board

EB 65 Report Annex # Page 13

	stockpiles of solid waste that are considered SWDS (according to the definition given for a SWDS)
Any comment:	The methane correction factor (MCF) accounts for the fact that unmanaged SWDS produce less methane from a given amount of waste than managed SWDS, because a larger fraction of waste decomposes aerobically in the top layers of unmanaged SWDS. In case of a water table above the bottom of the SWDS, a larger proportion of the SWDS is anaerobic and MCF shall be estimated according to equation (12)

of the SWDS is anaerobic and MCF shall be esting	nated according to	equation (12)

This measurement is only required once for each waste types that have similar national standards.	

• Empty fruit brunches (EFB), as their characteristics are similar to garden waste, the parameter value correspondent of garden shall be used; In the case

	<ul> <li>of i</li> <li>Industrial sludge, a value of 9% (% wet sludge) shall be used assuming an organic dry matter content of 35 percent;<sup>3</sup> In the case of d</li> <li>Domestic sludge, a value of 5% (wet sludge) shall be used, assuming an organic dry matter content of 10 percent<sup>4</sup></li> </ul>
Any comment:	The procedure for the ignition loss test is described in <i>BS EN 15169:2007</i> Characterization of waste. Determination of loss on ignition in waste, sludge and sediments.  The percentages listed in Table 4 are based on a wet waste basis which are concentrations in the waste as it is delivered to the SWDS. The IPCC Guidelines also specify DOC values on a dry waste basis, which are the concentrations after complete removal of all moist from the waste, which is not believed practical for this situation

Data / Parameter:	k <sub>j</sub>					
Data unit:	<mark>1/yr</mark>					
Description:	Decay rate	for the waste type	e <i>j</i>			
Source of data:		Guidelines for N	ational Greenh	ouse Gas Inve	entories (adapte	d from
	Volume 5,					
Values to be	Apply the	following default	values for the	different waste	e types j	
applied:	Table 5 De	efault values for	the decay rate	$e(\mathbf{k}_{j})$		
	Boreal and Temperate (MAT≤20°C)			Tropical (MAT>20°C)		
Was	Waste ty	pe <i>j</i>	Dry (MAP/PET <1)	Wet (MAP/PET >1)	Dry (MAP< 1000mm)	Wet (MAP> 1000mm)
	Slowly degrading	Pulp, paper, cardboard (other than sludge), textiles	0.04	0.06	0.045	0.07
	Slowly	Wood, wood products and straw	0.02	0.03	0.025	0.035
	Moderately degrading	Other (non- food) organic putrescible garden and park waste	0.05	0.10	0.065	0.17

This value, for industrial sludge, must be adjusted for other percentages of organic dry matter content as follows:

DOC (% wet sludge) = 9 \* (% organic dry matter content/35).

This value, for domestic sludge, must be adjusted for other percentages of organic dry matter content as follows:

DOC (% wet sludge) = 5 \* (% organic dry matter content/10).

Data / Parameter:	BMP <sub>MSW</sub> and BMP <sub>i</sub>
Data unit:	t CH <sub>4</sub> / t waste
Description:	Biochemical methane potential (BMP) of MSW or the residual waste type j disposed
	or prevented from disposal
Source of data:	Samples Samples
Measurement	Conduct a fermentation test on a sample of the MSW or the residual waste that is at
procedures (if any):	least 500 g in weight. The test should be undertaken according to a national or
	international standard, which may need to be adapted to conduct the test on a sample
	that is 500 g or more in weight. The duration of the fermentation test should be until
	no further methane is generated (indicating the complete conversion of BMP to
	methane). Take the average of at least three test results
Monitoring	At least three samples from different batches. Once calculated, the value determined
frequency:	is valid during the crediting period
QA/QC	According to the standard followed (or adapted) to measure BMP
procedures:	
Any comment:	The BMP is the basis of estimating DOC <sub>f,y</sub> and DOC <sub>f,m</sub> which describes the fraction
	of DOC that degrades under the specific conditions occurring in the SWDS (for
	example the moisture, temperature and salt content of the SWDS). For MSW, a
	default value for DOC <sub>f,y</sub> and DOC <sub>f,m</sub> may be used instead of measurement of the
	<b>BMP</b>

EB 65 Report Annex # Page 16

#### III. MONITORING METHODOLOGY PROCEDURE

#### **Monitoring procedures**

Monitoring involves an annual assessment of the conditions at the solid waste disposal site (SWDS) where the waste, in the absence of the project activity, would be dumped is disposed or prevented from disposal. Methane emissions from preventing disposal of waste at the SWDS can only be claimed if there is no gas from the SWDS being captured and flared or combusted.

#### Data and parameters monitored

Data / Parameter:	f <sub>v</sub>
Data unit:	-
Description:	Fraction of methane captured at the SWDS and flared, combusted or used in another manner that prevents the emissions of methane to the atmosphere in year y
Source of data:	Select the maximum value from the following: (a) contract or regulation requirements specifying the amount of methane that must be destroyed/used (if available) and (b) historic data on the amount captured
	Written information from the operator of the solid waste disposal site and/or site visits at the solid waste disposal site
Measurement	-
procedures (if any):	
Monitoring frequency:	For application A: Once for the crediting period $(f_v = f)$
	For application B: Annually
QA/QC procedures:	-
Any comment:	

#### UNFCCC/CCNUCC

Data / Parameter:	W <sub>x</sub> or W <sub>i</sub>
Data unit:	t <mark>ons</mark>
Description:	Total amount of organic waste prevented from disposal disposed in a SWDS in
	year x or month i (tons)
Source of data:	Measurements by project participants
Measurement	Measure on wet basis
procedures (if any):	
Monitoring frequency:	Continuously, aggregated at least annually for year x or monthly for month i
QA/QC procedures:	-
Any comment:	For application B

Data / Parameter:	$p_{n,j,x}$ or $p_{n,j,i}$
Data unit:	-
Description:	Weight fraction of the waste type $j$ in the sample $n$ collected during the year $x$ or
	month i
Source of data:	Sample measurements by project participants
Measurement	Sample the waste composition prevented from disposal, using the waste
procedures (if any):	categories j, as provided in the table for $DOC_j$ and $k_j$ , and weigh each waste
	fraction (measure on wet basis)
Monitoring frequency:	Minimum of three samples every three months
QA/QC procedures:	-
Any comment:	This parameter only needs to be monitored for Application B and if the waste
	includes more than one waste type j. Sampling is not required if the waste
	comprises only one waste type. This parameter only needs to be monitored the
	waste prevented from disposal includes several waste categories j, as categorized
	in the tables for DOCj and kj

Data / Parameter:	Z <sub>x</sub>
Data unit:	-
Description:	Number of samples collected during the year <i>x</i>
Source of data:	Project participants
Measurement	Minimum of three samples every three months
procedures (if any):	
Monitoring frequency:	Continuously, aggregated annually
QA/QC procedures:	-
Any comment:	This parameter only needs to be monitored for Application B and if the waste
	prevented from disposal includes several more than one waste categoryies j, as
	categorized in the tables for $DOC_t$ and $k_t$

EB 65 Report Annex # Page 18

Data / Parameter:	d <sub>v</sub>
Data unit:	<mark>m</mark>
Description:	Depth of the SWDS
Source of data:	Project participants
Measurement	Monitoring well that is also used to measure the height of the water table (h <sub>w,y</sub> )
procedures (if any):	
Monitoring frequency:	Monthly, average annual values to be used in the case of application of the yearly
	model (equation (1))
QA/QC procedures:	<u>-</u>
Any comment:	This parameter needs to be monitored to identify whether the SWDS has a water
	table above the bottom of the SWDS, such as due to using waste to fill inland
	water bodies, such as ponds, rivers or wetlands. If the SWDS does have a water
	table above the bottom of the SWDS, then this parameter is used to determine the
	MCF Control of the co

Data / Parameter:	h <sub>w,v</sub>
Data unit:	m en
Description:	Height of the water table in the SWDS
