

The very basic purpose of CDM is to encourage the projects which will lead to decrease in the GHG emissions. There may be many projects which are financially viable without CDM revenues but if they are facing any one of the barriers out of technical, common practice or regulatory(other) barriers, then these should be considered additional and given the CDM benefits. This will in the long run encourage people to invest in similar projects activities which will also give them CDM revenues and ultimately lead to reduction of GHG emissions.

The above should be carried out till the new such project activities face the common practice barrier.

As a further recommendation, we would like to say that a Tool for Common Practice Analysis should be there, as in the case of Financial Barrier.
