Global climate policy failed by (m)any means

Source: IPCC 5th assessment report – WG III

GHG emission growth in developing countries outpaces Annex I mitigation

Source: EDGAR 4.2 (1970–2008); IEA, 2011; USGS, 2012; WSA, 2012; NOAA, 2012

Past progress is being reversed

Decomposition of the Change in Total Global CO₂ Emissions from Fossil Fuel Combustion

Source: IPCC 5th assessment report – WG III

The uneven challenge to limit Climate Change to 2°C

WHAT DO WE NEED TO BRIDGE THE GAP?

- Non-OECD countries as they account for 90% of population and energy demand growth and require huge investments in infrastructure and mitigation
- Energy causes 66% of global GHGs & non-OECD account for 100% of growth;
- The 450 (ppm) scenario requires additional investments of \$11.6 trillion;
- GHG intensive thermal expansion is still the baseline and leads to a technological lock-in which is capable to close the door to 450 ppm.

The challenge ahead according to the WEO 2011

“If we do not change course, by 2017, 100% of the permissible energy sector emissions will be locked in.

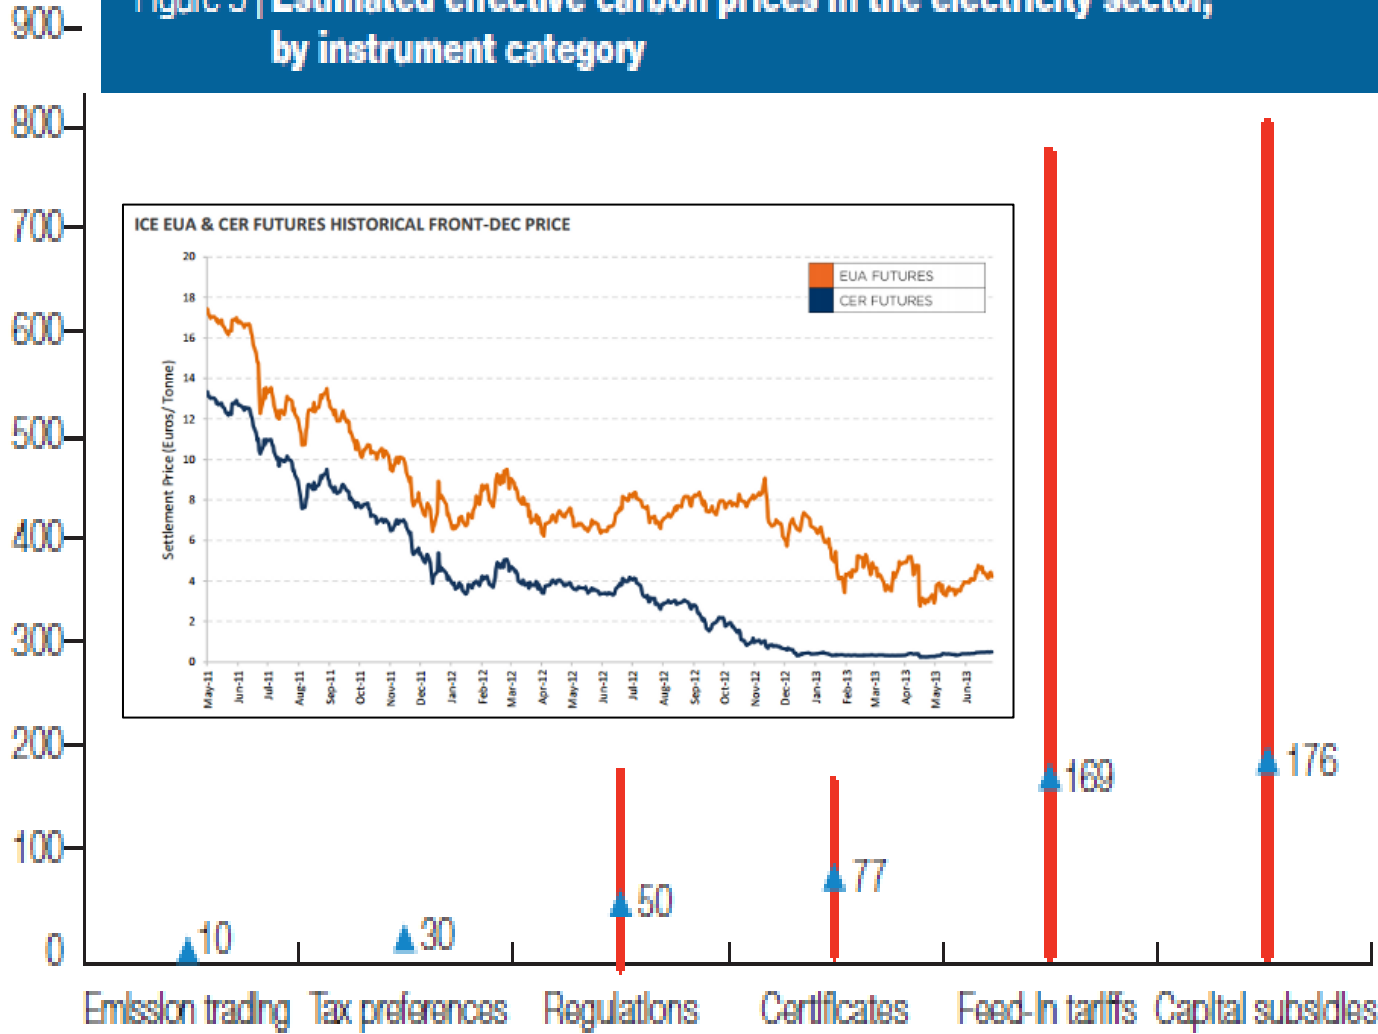

Maria van der Hoeven - Executive Director IEA

- In a policy driven scenario to achieve 450 ppm CO₂ prices in:
 - OECD will converge to \$120/t in 2035;
 - BRICS is to rise from \$10/t in '20 to \$95/t in '35.
- Cost is time dependent and increasing: ***Each US\$ investment delay will cost 4.5 US\$ investment in 2020.***
- Though no direct link between markets expected before 2035, **all systems have access to offsets (indirect linking)**, leading to price convergence
- If all countries began **immediate mitigation, establish a single global carbon price and use of all technologies**, economic costs is limited to 0,06% reduction in annual consumption growth until 2100 (IPCC 5th AR WG III)

Outright Carbon Pricing is out of fashion, but costs are rising

2010 EUR per tonne CO₂ abated

Figure 5 | Estimated effective carbon prices in the electricity sector, by instrument category

Graph shows minimum, maximum and simple average ▲

Importance of a global carbon market

Perspective and objectives of emerging countries:

■ OECD perspective:

- Mitigation requires gradual reform of infrastructure
- Mitigation cost to be contained by substituting depreciated assets with new technologies
- Mitigation Potential is insufficient when compared to emission grow of non OECD countries

Importance of a global carbon market

Perspective and objectives of emerging countries:

■ OECD perspective:

- Mitigation requires gradual reform of infrastructure
- Mitigation cost to be contained by substituting depreciated assets with new technologies
- Mitigation Potential is insufficient when compared to emission growth of non OECD countries

- **OECD needs time for smooth transition and asset rotation**
- **Non OECD needs immediate incentives for clean growth**

Results of the CDM in KP 1

Indicator	HFC	N ₂ O	Others	RE
Issuing	19	57	389	2151
Registered	20	104	1.057	6.355
Specific Invest US\$/tCO ₂ p.a. – UNEP	0,72	13.5	384	572
Invest MUSD (from UNEP data)	59	797	37.477	425.922
Issued (MCERs)	507	258	281	375
Revenues (75% sCER price)	4,779	2.355	2.497	2.878
Revenues/project MUSD	238	22,6	2,3	0,45
Non Annex I emissions 2001/2011 (CAIT)	+140% (F-gases)	+19% (N ₂ O)	Energy: +70% CH ₄ : +18%	

- 38% of resources spent on 19 projects in a sector that in 2000 represented 1,3% (102 Mton Non-A1) and grew to 2% of global GHG emissions (319 Mt in Non-A1 in 2011).
- Thousands of clean infrastructure investors were left with financial impairments that weaken investment capacity going forward.

Market barriers and solutions at hand

According to Economic Theory each market failure requires a specific instrument.

Quantify external cost and benefits

Sound MRV for GHG emissions and emission reductions ensure global comparability

Pricing external costs & benefits

CDM & NMM are globally coherent steps to build an international carbon market.

Inefficient Capital Markets

Development Banks & Green Climate Fund can bridge financial barriers.

Lack of enabling environment

NAMA policies with international support need to improve clean investment environment

Lack of access to technology and organizational knowledge

CTCN and bilateral organizations are available to support host countries on request

Build on and combine existing & emerging policies

Value GHG Reduction

- Carbon Market Instruments (CMIs) identify “least cost options” and assure profitability

Provide Funding in Least and Less DC's

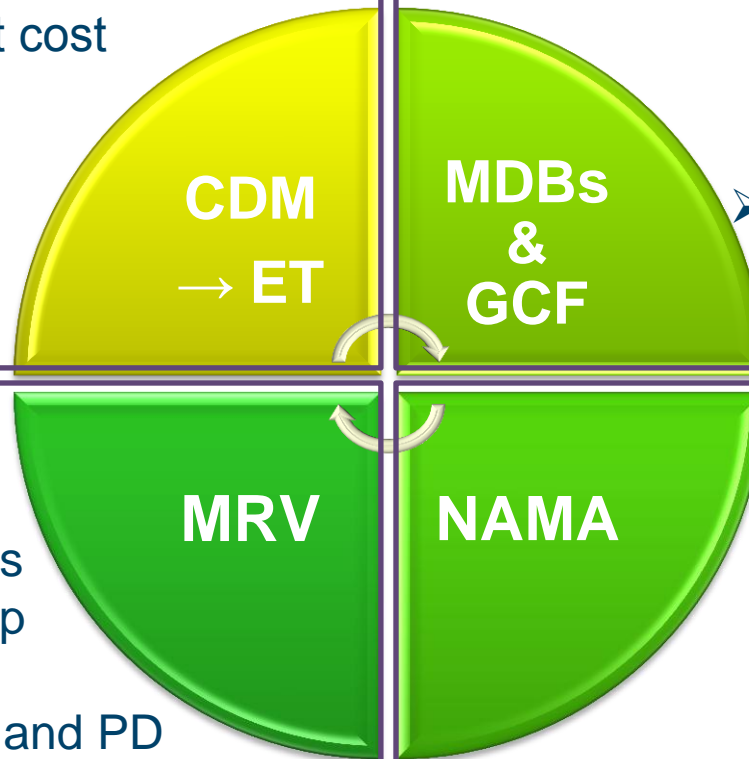

- MDBs & GCF finance clean growth & attract Private Sector
- CDM adds credibility & assures profitability

MRV

- CDM offers well established principles for MRV & bottom up baseline setting
- Unparalleled DOE and PD capability is (still) available

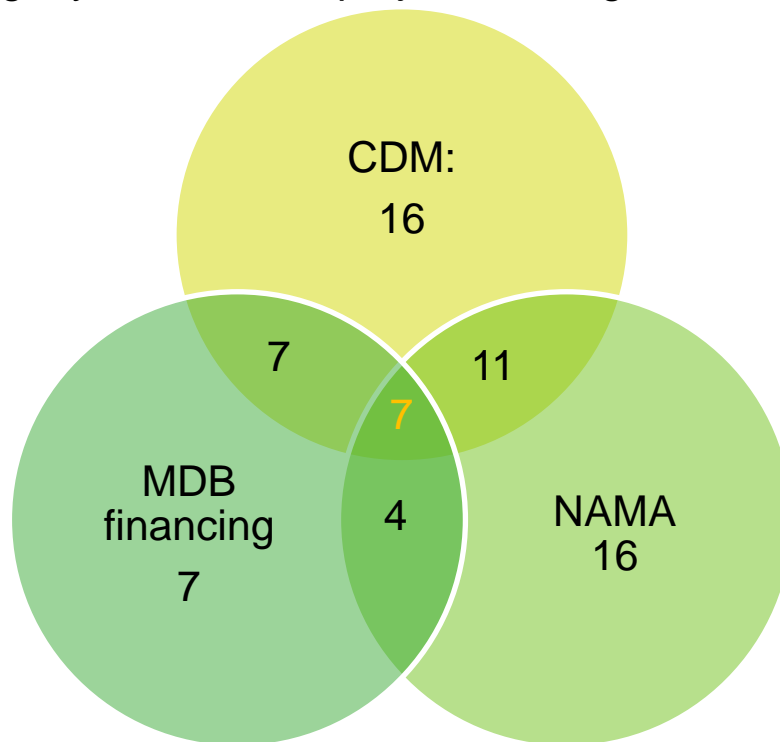

Domestic Efforts:

- Advanced DC's & private sector finance NAMA investments
- National policies allow sector wide programs & activities
- National demand for offsets to Tax or C&T

GDF SUEZ Experience with clean energy & support policies

- 16 Projects registered under the CDM
- 16 Projects are supported by national policies (NAMA)
- 7 Project financed by Multilateral Development Banks
- Uruguay NAMA LNG project seeking MDB financing

Distribution of technologies & countries: 10 Mio CER p.a.

■ Combination of incentives mitigates individual policy risk

Conclusions and suggestions for discussion

Problem: *Capital Intensity and long term maturity of clean infrastructure is the biggest barrier to green growth and a risk to our climate.*

Solution: *Transformational change is a result of global cooperation to address all market failures at once.*

Role of the CDM : *Offer comparable & solid MRV & flexible mechanism,*
i) in support of national policies (NAMA, etc.)
ii) in complement to Carbon Financing (RBF)
iii) for domestic offsetting and indirect linking between countries
to ensure transformational investments and a move towards an incrementally global carbon market.

Important CDM reforms:

- 1) Open access to & promote early action by all parties, IMO & ICAO.
- 2) Recognize early action but ensure LT commitment of buyers.
- 3) Additionality to target efficient use of resources to deviate from BAU and prevent global GHG intensive lock-in.
- 4) Develop sectoral mechanisms based on sectoral NAMA policies.
- 5) Reduce costs & bureaucracy to attract developing countries.
- 6) Establish due tracking and accounting of units (CDM->JI).
